Have confidence in your data, put the power back into Power BI

About Power BI Healthcheck with Coeo:

Is your Power BI environment sprawling out of control? Is there a lack of confidence in the reporting platform? Do you spend more time resolving Power BI issues than building capability?

At Coeo, we understand that for many organisations' Power BI can be deployed quickly, in different business departments often alongside other business intelligence tools. Whilst democratising data and reporting can accelerate business growth, it comes with many challenges.

We are a specialist Microsoft Data & AI partner ready to take you on this journey of education and remediation to improve trust in Power BI and run a high-performing business intelligence platform ready for the future.

What we offer

Coeo will support your organisation to assess the current state of your Power BI environment, provide expert guidance and next steps recommendations in line with best practice industry standards.

A combination of workshops and a read-only review of the Power BI tenant configuration with an experienced Coeo Analytics consultant will work with your technical key stakeholders to capture critical detail on how you are using Power BI, where it is deployed, the total cost of ownership and overall security posture of the platform.

Once captured, assessment detail will be converted into a digestible rag status report to reflect security, performance and operational issues with the platform.

Coeo will then provide prioritised recommendations to ensure that you have a clear roadmap to platform remediation and cost optimisation.

Key healthcheck areas

- Architecture Review
- Dataset and report duplication
- Data source integration
- Cost optimisation
- Security and access controls
- Operational excellence and data governance
