

# M365 Protecting Corporate Identities

Take control of the identities in your organization:  
Human or machine | On-premises or hybrid | Regular or privileged

**Identity-driven breaches can wreak havoc on organizations. With the suite of identity solutions that Microsoft 365 offers, you can secure your identities, expand visibility, and prevent costly breaches from happening to your organization.**

KiZAN will assist your organization with the deployment of the following to secure your devices, users, and services accounts identities.

**MFA/SSPR** to secure user access to corporate resources

**Microsoft Defender for Identity** for onsite Active Directory signals

**Azure Identity Protection** for Azure Cloud signals

**Privileged Identity Management** to enable you to limit standing administrator access to privileged roles, to discover who has access, and to review privileged access

**Conditional Access** review to strengthen security and validate protection.

Secure these identities that exist not just in Azure Active Directory, but also on onsite Active Directory domains. Wade through the complexity by viewing signals from all sources in Microsoft 365's user-friendly interface and receiving regular reports to aid in the continuous improvement of your identity security posture.

## M365 Protecting Corporate Identities Deliverables:

- ▶ Protecting Corporate Identities Overview w/leveraging and planning session for:
  - MFA/SSPR
  - Microsoft Defender for Identity
  - Privileged Identity Management
  - Azure Identity Protection
- ▶ Generate a design document and implement the solutions
- ▶ Provide Education on the solutions implemented

**The engagement includes planning and enforcing user identity access rights according to the Principle of Least privilege. Education, planning, design, and implementation are all included in this effort to accelerate securing identities during this engagement and beyond.**
