

# Intune for iOS

Implementation Service for Corporate and Personal iPhones & iPads

# Smartphones and Tablets are critical work devices

Users are using smartphones and tablets to conduct work. Whether corporate provided or personally owned, many users check email, review documents, share attachments, and more.

Yet companies are lagging in protecting corporate data on smartphones and tablets – especially personally owned devices.

**Intune for iOS provides you with a balanced solution for corporate & personal devices that protects your data while respecting employee privacy.**

✓ Corporate iPhones & iPads remotely provisioned and updated.

✓ Corporate iPhones & iPads deployed without a personal Apple ID.

✓ Personal iPhones and iPads receive application management without users having to hand over full control of their device.

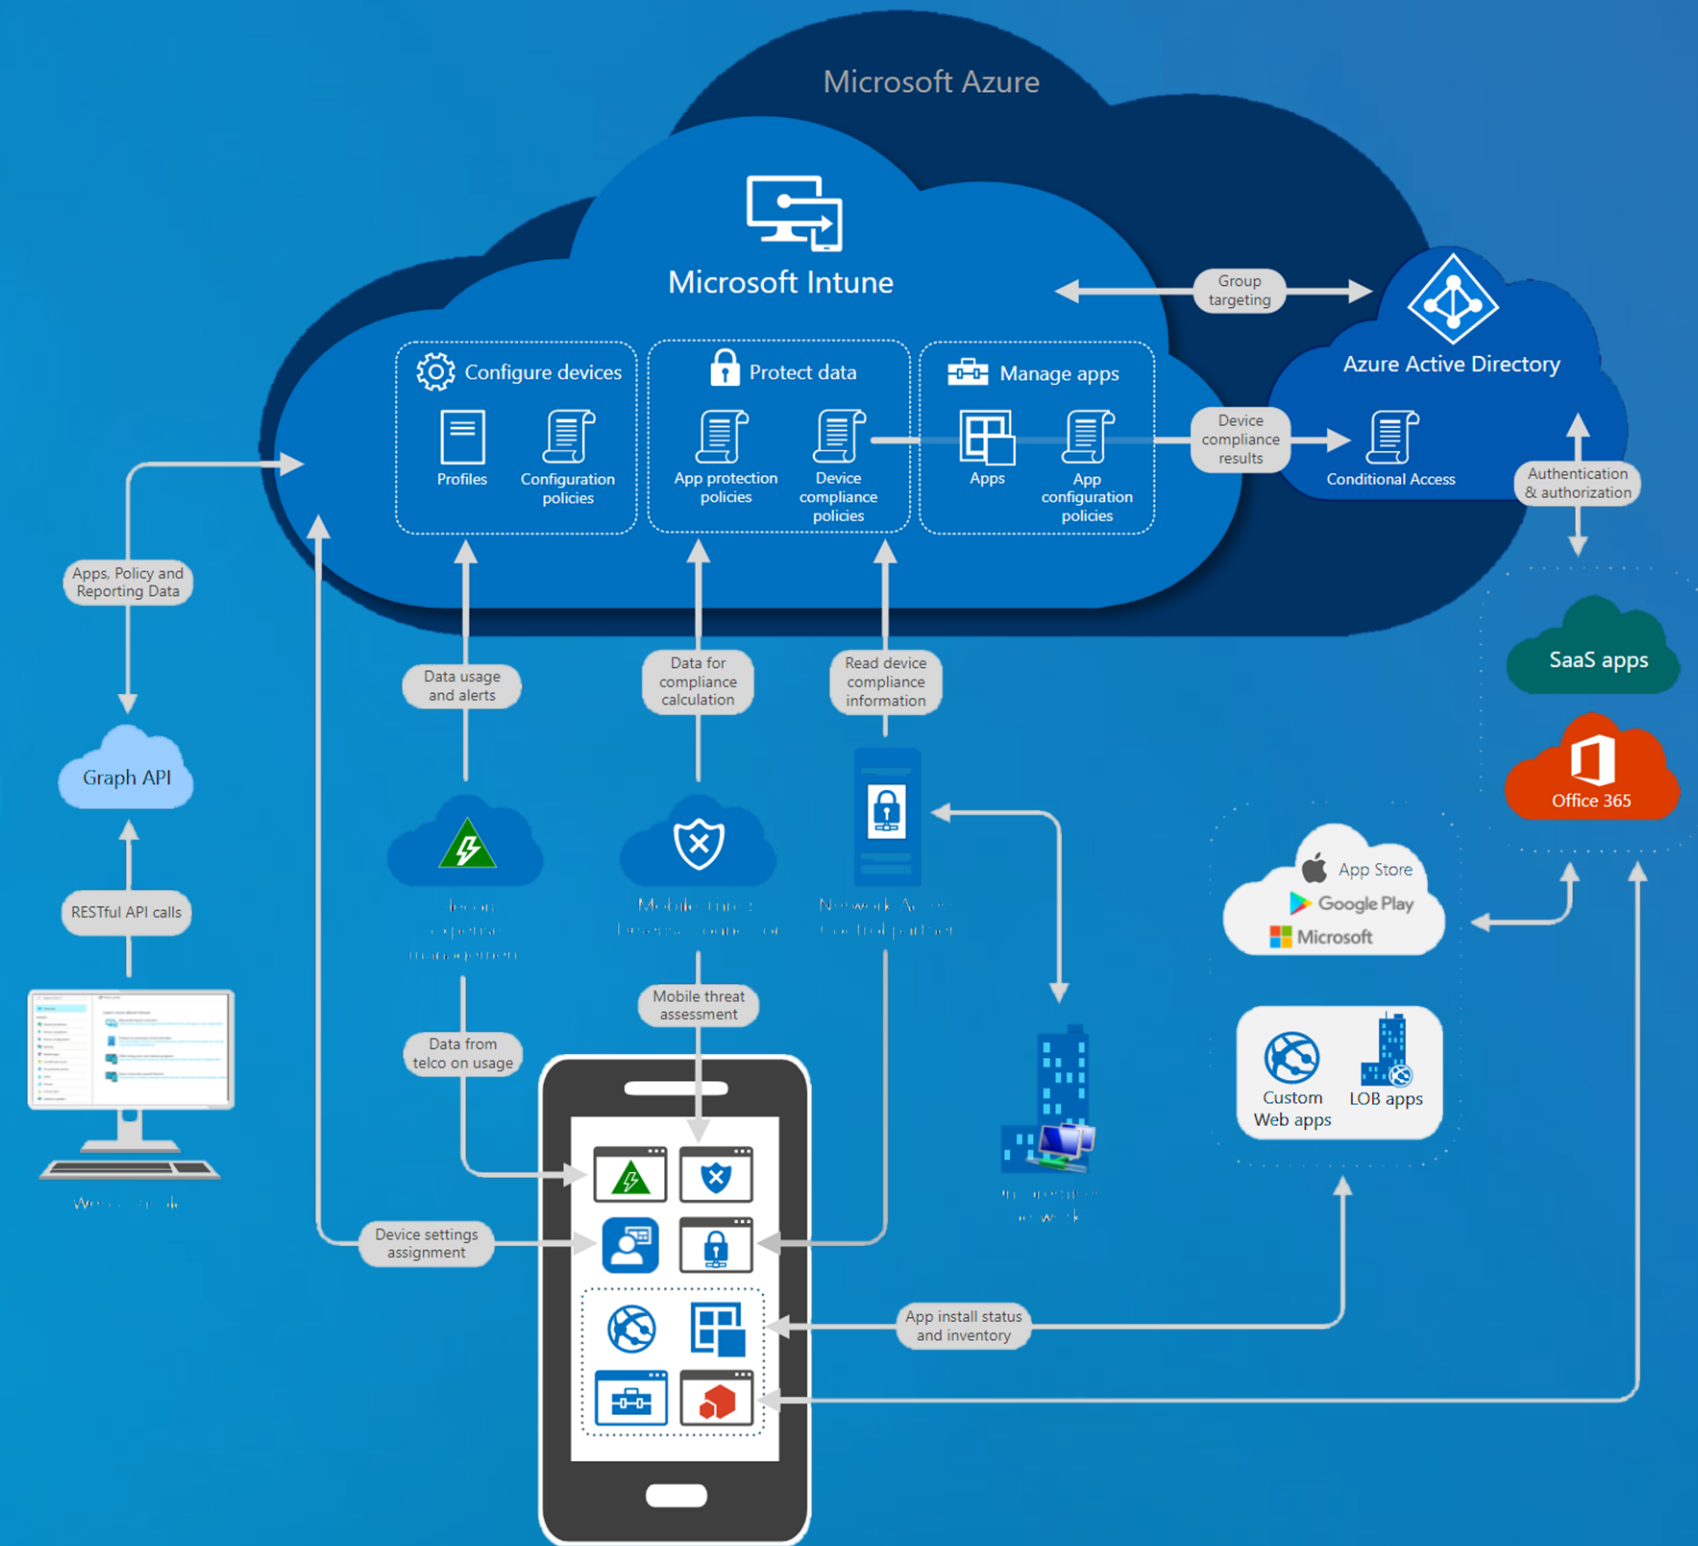

# Device Management

With Device Management, you control the device. This means you can setup a corporate app store and deploy apps, Wi-Fi and configurations automatically.

You get maximum control of the device and any data on the device.

It means users will experience less privacy.

We recommend Device Management for corporate devices and for personal device use cases where clinical or other regulated information is used for work.

# Application Management

With Application Management, devices have protections for data use in work apps like the Office Suite, Outlook, Teams, Adobe Reader, and a few other common apps.

Application Management does not require users to give up control of their device, and IT will not be able to see or manipulate personal data and personal apps.

Application Management is recommended for most personal device use cases. There is no corporate app store, nor can you deploy apps to users with Application Management.

# How it Works

Our Intune for iOS package follows our proven formula. We do technical discovery and design a solution that secures company data while respecting employee privacy.

We then implement the design in your Intune environment – providing you a custom build that meets your needs.

Finally, we'll test the build and teach you how it all works. You'll get as-built documentation so you can archive your starting point.
