

# Intune for Windows

**Intune transforms the way Windows machines are provisioned, secured, updated and managed**

Traditional management requires devices to be inside your network and requires IT to manually provision each device with an image

**Intune for Windows is a service package to configure Azure AD and Intune so you can evaluate Intune management of your Windows devices**

## Our service delivers these valuable outcomes

- ✓ Windows 10 can be setup remotely without manual work by IT
- ✓ Devices can be managed outside of the corporate network
- ✓ Applications can be deployed to devices remotely
- ✓ OS and applications can be updated remotely
- ✓ Cloud-based device security with Intune

## How it Works

**1** **Step One**  
Discovery  
and Design

**2** **Step Two**  
Configuration  
and Testing

**3** **Step Three**  
Knowledge  
Transfer

“SCCM was cumbersome and at times difficult to work with, Intune is much easier to manage updates and installations and since moving to Intune have found we no longer need SCCM.”
