Data Platform Modernization Starts with a Microsoft Fabric Envisioning
Workshop led by Sonata Software

Organizations struggle to deliver accurate data to the business efficiently, cost-effectively, and within deadlines. The limitations of data infrastructure and foundation create challenges for IT in ensuring data availability, discoverability, relevance, and traceability.

IT and the business face hurdles in fostering a data-driven culture for enhanced business agility, customer insights, and employee experiences:

- **Business requests for data, insights, and analytics experience delays.**

- **Manual efforts are required to reconcile data across applications and data estates.**

- **Disconnected data estates hinder the ability to provide valuable insights for business agility, seamless customer experiences, and improved employee satisfaction.**

- **Scaling and meeting data expectations in the current data estate (infrastructure and foundation) incurs considerable time and cost for data integration, engineering, and quality.**

- **Managing data platforms across hyperscalers and on-premises environments at scale and with optimal efficiency poses challenges.**

Microsoft recently released Fabric, their revolutionary Data Management and Analytics platform to address crucial challenges that businesses face today. It caters to all aspects of an organization's analytics requirements, providing a unified and collaborative experience. This is achieved regardless of the data location, ensuring seamless integration and collaboration throughout the analytics process.

At Sonata Software, we believe Fabric is pathbreaking in what it can do for customers who are modernizing their global data estate. In fact, we have been a Microsoft Fabric launch partner the past year thus gaining valuable insights into this platform and sharing our comprehensive learnings with the Microsoft engineering team to help shape this product.

Starting with our **FREE 2-hour customer workshop** that is designed to cater to individual customer needs helps you **focus on the art of the possible in achieving your data modernization goals**. Sonata Software will provide a high-level roadmap that highlights key data foundation and infrastructure system objectives that allow you to respond to business needs with greater speed, agility, and affordability.
