

Devolutions

DATASHEET

Benefits

- Easy-to-use cloud-based password management solution for team environments.
- Implement best password practices and control password behavior across the organization.
- Generate detailed reports for compliance, governance and auditing purposes.
- Password management features that capture, store and fill credentials for any web-based login.
- Launch remote connections to servers, websites and applications directly from the Password Hub platform.
- Increase users' and IT satisfaction due to ease of use and simple deployment.
- Eliminate password fatigue and security lapses.

Specifications

Security

- AES-256 encryption
- Hosted with Microsoft Azure
- Breach verification setting for masterkey

Client Application

Entries are managed directly from the web interface.

Cross-Platform

Desktop and mobile applications available.

PASSWORD MANAGEMENT FOR TEAMS AND BUSINESSES

Increase Password Security,
Enhance Productivity
and Simplify Business
Users' Experience

OVERVIEW

In order to reduce the growing risks posed by insider threats and data breaches - and also to meet increasingly stringent audit and compliance requirements - organizations need to control and monitor sensitive information and privileged access. Yet at the same time, organizations need to strike a balance between keeping critical assets secure and enabling users to be productive and efficient. Devolutions Password Hub delivers the best of both worlds: robust enterprise-grade password management security, with an intuitive and optimized user experience.

Controlled by IT pros and loved by business users, Devolutions Password Hub is a secure and cloud-based password manager for teams. It empowers your organization to easily and securely vault and manage business-user passwords, along with other sensitive information, through a user-friendly web interface that can be quickly, easily and securely accessed via any browser. Simply put, Devolutions Password Hub is the perfect balance of security and usability.

FEATURES

High Defense Against Intrusion

Passwords are the keys to the IT kingdom and as such should be protected with the highest level of security and protection. With the proliferation of the number of passwords used, bad practices, such as reusing the same password for multiple accounts or storing passwords in an unsecured spreadsheet, are more and more common. These practices may lead to unauthorized users gaining access to privileged accounts, which could cause irreparable damage to your organization's reputation. Devolutions Password Hub helps organizations increase their defense system and protect data against such threats.

- Apply Two-Factor Authentication to add an additional layer of protection to accounts, thereby strengthening security while ensuring that only authorized users have access to privileged assets.
- Avoid mishandling of sensitive passwords by storing all passwords of each department under a centralized repository to help consolidate account credentials in one single place.
- Reduce access-related risks by sharing data on a need-to-know basis using a comprehensive role-based access control system, which allows for the creation of a granular protection system.
- Maintain accountability and security while sharing access with authorized users by allowing them to access an account without being able to see any login information.
- Security and privacy are non-negotiable, which is why Password Hub provides each organization with its very own cloud-hosted database to keep all information securely stored in a private infrastructure.

User Enrollment

Employee adoption is vital to any organization's security health. To ensure that business users enroll in password management best practices, we have to empower them with simple and intuitive tools that will help users handle basic password management tasks on their own. Without those features, business users will continue to use bad password management habits, make expensive support calls, and prevent your organization from realizing a high return on investment.

- *Password Generator* – Business users can automatically generate better, stronger and unique passwords, thus increasing their security and decreasing huge points of risk for the organization.
- *Private Vault* – Each user is provided their very own private vault, which is a user-specific compartment that stores business user credentials and passwords only they can access. Admins can monitor password reuse and regulate data in a shared vault without compromising the privacy of the private vault. It also helps increase security by consolidating credentials in Password Hub instead of having business users rely on less secure tools to manage their personal passwords at work.
- *Intuitive User Interface* – The clean and simple user interface makes it easy for business users to find what they need, when they need it.
- *Increase Business User Productivity* – Provide your users with easy-to-use tools like credential injection and automatic web login. These tools will not only increase your business user productivity by saving them time, but it will help alleviate the burden of managing end-user passwords for sysadmins.
- *Access Anytime, Anywhere* – Password Hub, being a cloud-based solution, is always connected, synchronized and shared in real time with each user, so they can access the passwords they need anytime, anywhere.

Companion Tools

To increase functionality, efficiency and performance, Devolutions Password Hub can be enhanced by two companion tools:

- *Devolutions Web Login* enables users to automatically connect to websites without having to remember passwords. This extension browser is the main tool used to quickly access websites.
- *Devolutions Launcher*, which is available for Windows, Mac, Linux, Android and iOS, allows users to automatically launch remote connections to servers and applications directly from Password Hub. The security of your organization will never be compromised, since all account information is transmitted directly from the password vault into the remote session via Devolutions Launcher's secure API, keeping attuned to the latest military-grade security standards.

Enforce Organizational Standards

Password Hub is designed to keep systems safe from external cyber criminals and insider threats, and to accommodate the widest range of organizational requirements and data security standards. In addition, Password Hub helps evaluate your organization's security strategy, ensuring that passwords conform to standards for length, composition, and password history with comprehensive reports.

- *Activity Logs*: Navigate through detailed access logs to keep track of all privileged user activity.
- *Administration Logs*: The administration logs keep track of administration level activities, such as added, modified or deleted vaults and users.
- *Deleted Entries Reports*: Generate reports that list every deleted entry in the vault you are currently browsing from. It is possible to restore a deleted entry from those reports.

Unified Control for IT Professionals

Regardless of the entry point, IT visibility into the organization is critical for security. Password Hub is designed to make life easy and efficient for business users, while being fully managed and controlled by IT professionals, enabling them to grant right access to the right people at the right time.

- *Total Access Control* – Administrators can quickly and easily grant, change or restrict access for any user.
- *Add, Modify and Remove Users* – Administrators have the power to add, modify and remove users based on changing needs and policies.
- *Intuitive Admin View and Tools* – The intuitive Administrator View and related tools are designed to help IT professionals get more done in less time.

Password Hub Subscriptions

Devolutions Password Hub subscription packages include access to Devolutions Password Hub, unlimited storage in the cloud, and access to Devolutions Launcher and Devolutions Web Login

ABOUT DEVOLUTIONS

Devolutions is a global software company that helps organizations worldwide control the IT chaos by maximizing security through highly-secured password management solutions, remote connection solutions and privileged access management solutions. Since 2010, Devolutions has been a leading security partner with more than 400,000 users spread across 140 countries.

Its clientele includes such world-renowned companies as SpaceX, Shell, Loto-Québec, Walt Disney, NASDAQ, Dell, Sony, Microsoft, Pfizer, Airbnb and NASA.
