OUR PROVEN PROCESS TO HELP SIMPLIFY IT MANAGEMENT FOR YOUR ORGANIZATION

MEET

We first meet with you to learn about your organization's challenges and goals.

DISCOVERY

We then will assess your current IT infrastructure and IT management processes and start evaluating potential solutions that will help.

TAILOR

Our solution architects will collaborate with your team on developing a customized solution architecture.

DELIVER

We assign a dedicated project manager and expert engineers to implement our solution recommendations and deliver a project hand-off to ensure a smooth transition.

ONGOING PARTNERSHIP

Once the solution is delivered, we will assign a vCIO and dedicated technical manager to ensure the solution continues to meet your goals and to help with implementing any innovations that might help.

THE SOLUTIONS WE PROVIDE TO HELP SIMPLIFY IT MANAGEMENT

Virtual Desktop Infrastructure

Eliminate the need for VPN for remote users while reducing the time to deploy applications and updates.

Server Virtualization

Transform the way you manage and maintain your servers by switching to a solution with a single pane of glass and zero downtime.

Backup & Disaster Recovery

Be proactive before the next outage hits. Our solutions allow you to test backs up and failover with little time or effort during the day.

Firewall Analytics & Management

Get the complete picture you need that command line doesn't provide. You can have a single pane of glass, with analytics and fabric integration, without having to be a CCIE.

Endpoint Management & Protection

Become the master of your domain with endpoint management. Protect documents, apps, devices, sites, and networks with immediate notifications.

Network Assessment

Don't wait for a disaster to reveal performance and security issues. Now is the time to be proactive and have a full assessment of your network done.

Strategic IT Planning

A strategic IT plan means a lot less headache and more progress. Your technology should be an asset, not a liability.

NOC/SOC

Stop spending time, money, and resources reacting to attacks. Cyber Security Monitoring proactively analyzes security events and threats that would have taken several weeks or months to identify.
