annual
subscription

Extracting, preparing, cleaning, standardizing, generally transforming and then saving data - these are classic steps in an **ETL (Extract - Transform - Load)** process. No matter how and where you want to process your data, in over 90% of all work that has to do with data, such tasks arise. Today, these steps are often referred to as Data Wrangling, Data Munging or Data Massage.

With Power Query - already integrated in Excel - and our oh22is Data Toolkit, you can now transform Excel into a full self-service ETL tool. Load data from any data source and transform it directly in Excel using Power Query and then save the processed data in a target of your choice.

- With the Data Toolkit it is possible to store data in various destinations, such as Microsoft SQL Server, Power BI, Azure Data Lake Store or SAP HANA
- Data can be exported to various file formats, such as Apache Avro, JSON or T-SQL
- With the Queries & Connection function you can directly access Power Query Connections and Queries created in the Excel Workbook

Streamline your data processing processes considerably with the oh22is Data Toolkit and transform Excel into your personal self-service ETL tool.

Currently the following targets are supported:

- Microsoft SQL Server
- Dynamics 365 CE
- Azure Cosmos DB (Document DB)
- Azure Table Storage
- Power BI
- Azure Data Lake Store
- Azure Event Hubs
- SAP HANA

The following output formats are available:

- Apache Avro
- JSON
- SQL (Insert-Statement)
