

The Cloud Competence Center

What is a Cloud Competence Center?

- A centralized function that maintains cloud adoption best practices, core infrastructure, security control implementation and onboarding of customers to the cloud
- By establishing a Cloud Competence Center, an organization can ensure all cloud customers operate using best practices

Why a Cloud Competence Center?

- Cloud adoption is often driven by separate individual projects or shadow IT
- Developers want to focus on adding value by building products, not networking, security, accounts or user management
- The architects and developers with most cloud knowledge are overburdened by trying to support other teams -> cannot focus on their products
- Managing cloud governance and realizing cloud benefits becomes a challenge
