Data warehouse development at the speed you need

Data Vault automation

Speed up multi-source data integration and Data Vault modeling.

Save your team months of headache, confusion, and re-work with our built-in integration templates that don't require code writing.

Controlled execution

Master upfront data warehouse work through our easy guided setup, tested logic, and error & exception handling.

Eliminate technical debt

Replace repetitive, error-prone human work with automation. Our built-in integration templates deal with both tech complexity and business model mapping.

Built for change

When a new column or source is added, or technology is upgraded, it's simple to adapt your data model by generating delta and migration logic.

Data Vault 2.0 certified

Our tool is the first and only one officially certified by the Data Vault Alliance.

Guaranteed data integrity

We deliver an accurate and complete data model that reflects your business, addresses your needs, and keeps track of data over time.

No runtime costs

VaultSpeed is not a runtime app. You only pay for jobs related to building and adapting the Data Vault model, not loading the actual data.

Easy to install

VaultSpeed is Cloud Native. All you need to do is install our Java agent which harvests metadata from your database and deploys the necessary code. Access your work through a browser.

Secure by design

Your data is 100% safe. We provide a secure connection to your sources and will only extract metadata, never actual data.

Easy to use

VaultSpeed's intuitive interface, built-in integration templates, and step-by-step setup simplify upfront data warehouse deployment.

Best-of-breed technology support

VaultSpeed connects with the best CDC, ETL, source, and target technologies available today.
