Microsoft 365 Configuration Lifecycle Management

Configuration As Code Management For Microsoft 365

Microsoft 365 has become a best-in-class solution. However, **management is limited** to the Microsoft portals and scripting. Simeon Cloud delivers **infrastructure management** using configuration as code and provides automation, control, consistency, transparency, and traceability to the Microsoft 365 ecosystem.

Control

Microsoft 365
- ✓ Security
- ✓ Compliance
- ✓ Continuity
- ✓ Efficiency

Automation   **Consistency**

Traceability   **Transparency**

✓ **Establish and maintain baseline configurations** for Microsoft 365 policies, settings, and Intune applications.

✓ Easily create **non-production** environments and promote changes into production to implement end-to-end **lifecycle management**.

✓ Apply **version control**, track changes, and restore previous configurations.

✓ Empower non-developers to manage configuration as code with our **friendly user interface**.

What Our Customers Say About Us

"Simeon Cloud is a critical component of our Modern Digital Workplace and endpoint management programs. The Simeon platform enables essential governance for our Microsoft 365 environment. Since implementing Simeon, our team has reduced the time spent managing endpoint configurations and building Intune application packages by an order of magnitude. The automation we achieved and efficiency we have gained has enabled us to reallocate a team of engineers to focus on delivering new value rather than maintaining our M365 infrastructure."

- Eric Levin, CTO, GCM Grosvenor
