

# Azure Backup Plus Services

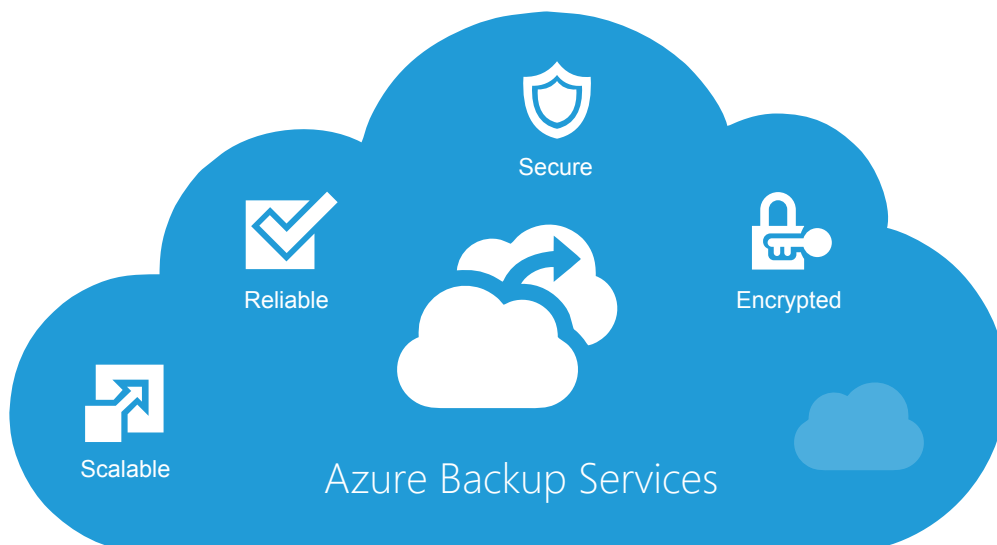

Azure Backup Plus Services is a cloud based service utilising Microsoft Azure to backup, protect, and restore your data when you need to.

Azure backup Plus Services is an area of security planning that aims to protect an organisation from the effects of significant negative events. The Azure backup Plus Services allows an organisation to maintain, or quickly resume, mission-critical functions following a disaster. Azure backup Plus Services is focused on organisations that cannot afford to be non-operational because of a catastrophic loss of application functionality, for example regional power outages, cyber-attacks, or hardware failures. Resilience and high availability strategies are intended to handle temporary failure conditions.

In such an instance, interruption of services will lead to loss of revenue. Companies need to consider how much

functionality is required to their business needs if a disaster occurs. There are different means for a company to achieve their desired goal for example completely unavailable, partially available via reduced functionality or delayed processing, or fully available. Whether it is from an on-premise or cloud-based environment, Azure Backup Plus Services encrypts all data through utilising standard 256 advanced encrypted data. Data is stored in the Recovery Services vault in Microsoft Azure. Only you, the client, can unlock this data. No one, including Microsoft, can decrypt the backup data. Azure Backup Plus Services includes; the management of the backup process, data, restore and increments of data. Guaranteed restore times are optionally available.

## Main Features:

- Simplify DR to recover multiple workloads from within the Azure Portal.
- Eliminate a secondary data centre by replicating directly to Azure.
- Easy replication testing without affecting production environments.
- Multiple data centre regions around the world.

## Your Data Safe In The Cloud

### Azure Site Recovery (ASR)

- Easily replicate and protect your applications running on Azure to different Azure regions.
- Simple to deploy and manage.
- ASR is backed by a 99.9 percent SLA and 24/7 support.
- Test your DR plan without effecting your Production environment.

### Azure High Availability

- Azure Storage maintains at least three replicas of all data in your Azure storage account.
- Use geo-replication to store copies of your data in a secondary region.

### Data Corruption Protection

- Easily store backups in Azure which is replicated to multiple regions.
- Use point-in-time restores to recover from data corruption.

### Azure Backup Plus Services Pricing

0 -10 Users	\$50
11-20 Users	\$50
21-30 Users	\$50
31-50 Users	\$60
51-100 Users	\$100
100 -1000 Users	\$140
1001+ Users	\$170
