

SMART EYE TECHNOLOGY®

PROTECT AND KEEP CONTROL OVER YOUR CONFIDENTIAL INFORMATION

Our Advantage

Smart Eye Technology is a **multi-factor biometric authentication and file sharing platform** that keeps sensitive files and data private and secure, with control literally at your fingertips.

Key Features

Screen Privacy

Continuous facial recognition vigilantly protects files from unauthorized viewing on any device by blocking risky screen snooping.

Secured File Sharing

Multi-factor biometric authentication restricts file access to intended recipients; while AES 256 encryption and UXP technology assure true end-to-end security (at rest and in transit).

Private Communications Pond

File sharing is restricted to only those employees and organizations you approve to collaborate with in the platform, preventing unauthorized communications.

Maintain Control Over Shared Files

The number of biometrics and access time limits can be customized by file; downloading and further sharing can be prevented; access is monitored in real-time; and file access can be immediately redacted, even after it has been opened.

e-Signature Identity Authentication

Biometric authentication is required to sign digital contracts, assuring that only the intended recipient can sign and verifying the signer.
