

Credential Manager

This advanced solution harnesses the capabilities of Dataverse, Power Apps, Power Automate, and Azure Key Vault technologies to redefine how organizations protect sensitive user credentials and information while enabling seamless access requests to organizational resources and client information.

In an increasingly interconnected landscape, maintaining the security of user data and access rights is paramount. No employee should ever be emailing or messaging any sort of password-based credential, especially with all the security breaches now a days. Credential Manager serves as a dependable fortress, allowing organizations to securely store user credentials in Azure Key Vault — a highly secure cloud location. Employees themselves can add credentials and request approval to credentials for different services.

Technologies used:

Power Automate

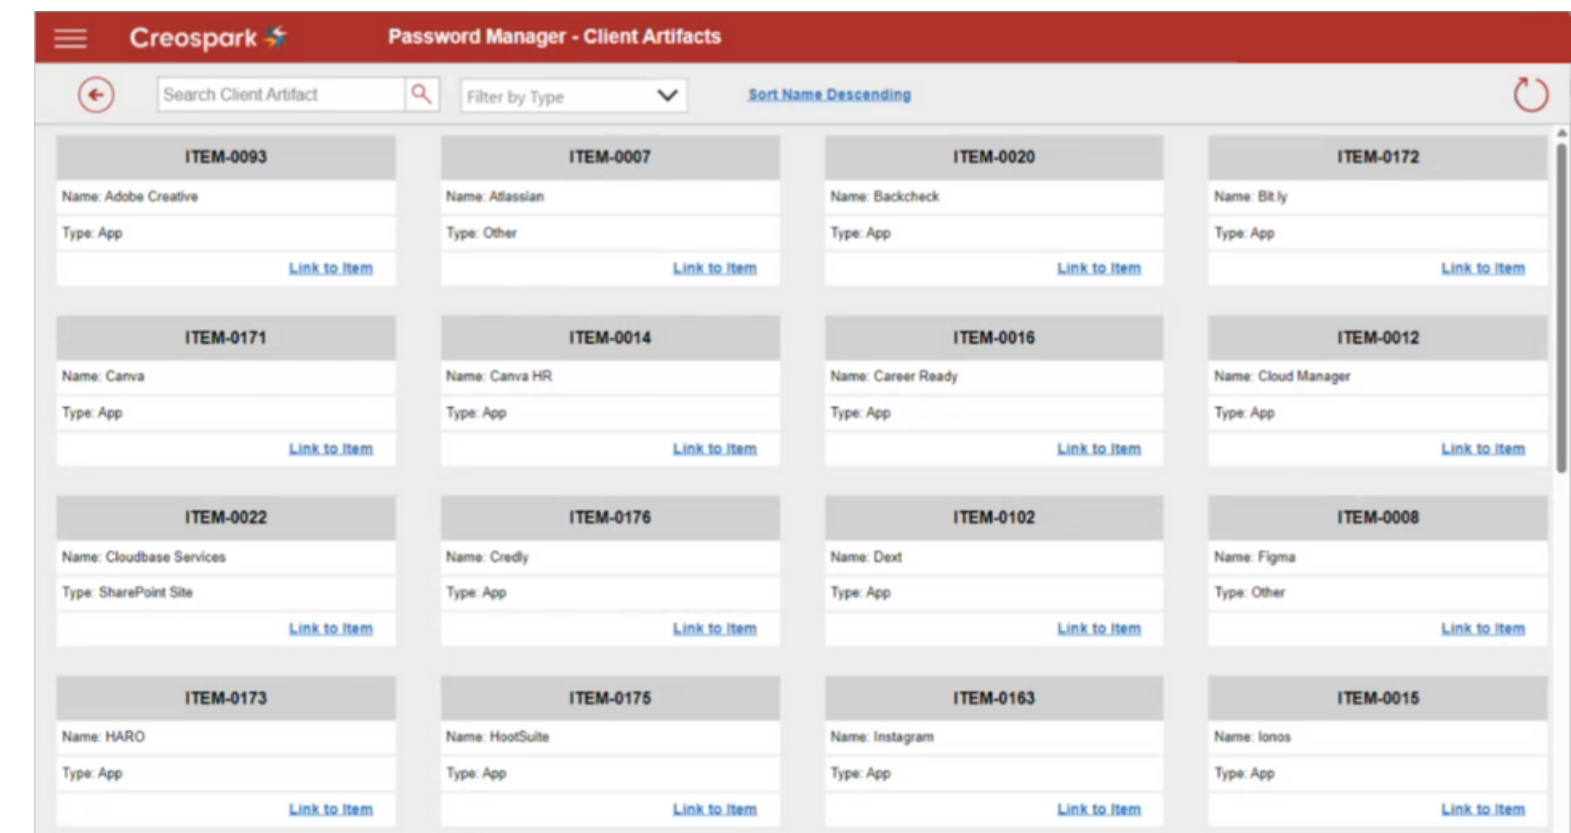

Power Apps

Azure Key Vault

Dataverse

We're here to help your organization understand, adopt, and love its technology
