

SQL Server Health Check

A SQL Server Health Check analyzes and evaluates the performance, maintenance, and infrastructure of your Microsoft SQL Server environment.

A KiZAN SQL Server DBA will work with you to customize the Health Check to your business needs. The analysis and evaluation can be targeted on performance issues, high availability or disaster recovery configuration, pre-migration, consolidation or upgrade assessment, efficacy of licensing, use of infrastructure, or auditing concerns.

The analysis will not only include the Best Practices Analyzer, but several custom scripts and stored procedures that monitor and report on your SQL Servers. Each instance will have a detailed workbook describing in detail your desired measures, and will be accompanied with documentation of recommendations based on our expertise. KiZAN will meet with you to outline those recommendations and highlight priorities with an estimated level of effort to remedy the situation and give you peace of mind.

This 2-day SQL Server Healthcheck may include but is not limited to the following:

- ▶ High Availability Configuration for Always On
- ▶ SQL Server Virtualization
- ▶ Back and Recovery
- ▶ SQL Server Best Practices
- ▶ SQL Server Performance
- ▶ Log Review
- ▶ Transaction Logs
- ▶ Workload Analysis
- ▶ Disk Utilization
