

AI scalability challenges

1. To achieve significant increases in revenue, the use of AI must be extended to hundreds of use cases.
2. Each use case requires developing custom AI algorithms, and each algorithm is manually developed by Data Scientists in 2-4 months.

Bionline Intelligent Revenue

A low-code / no-code platform that automatically generates new use cases or algorithms in less than 24h.

Therefore, achieving significant increases in revenue and scaling the use of AI is feasible.

“Low-code” empowers the team

Far from simply increasing workforce, low-code **changes the way business is done** and turns the process into a team sport.

Business users, IT, developers... **the whole team** can work on the same project, with the same platform and the same data.

Bionline Intelligent Revenue automates the entire process and supports the team.
