Microsoft 365 Defender: Attack Simulation

Evaluate the effectiveness of your policies and controls to protect against different types of cyber attacks.
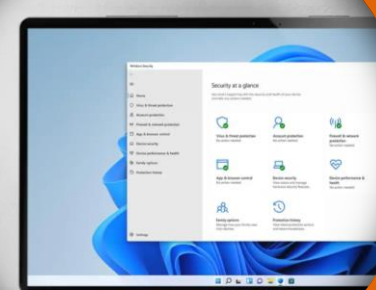

Run realistic attack scenarios that can help you identify and find vulnerable users before a real attack affects your organization.

Provides recommendations and guidance to improve protection and incident response

Improves regulatory compliance and security audits by demonstrating that preventive and corrective actions have been taken

Create custom simulations or use the predefined templates, which are based on real techniques and tactics used by attackers, to suit your organization's specific needs and objectives

Helps identify vulnerabilities and weaknesses in infrastructure, systems, applications and users

Facilitates employee training and awareness of security best practices and how to avoid falling victim to cybercriminals

Allows to assess the organization's security against different types of cyber attacks, such as phishing, ransomware, malware, etc
