

Protect and visualize your network traffic with dynamic bandwidth throttling

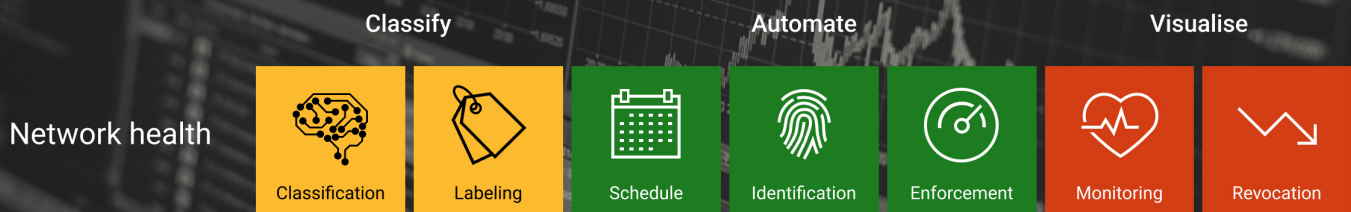

## A new way to protect your network bandwidth

StifleR understands and protects all types of networks so that you can deliver any type of software deployment to your end users without compromising on the timings or location of content delivery.

Works alongside any configuration management platform on premise or in cloud - **Microsoft Configuration Manager, Intune, Windows Update** and the **Windows Store** to name but a few. Built on industrial strength Microsoft technologies such as SignalR and delivery optimization.

### VPN/Home/Office/WAN/WiFi/Cloud – StifleR loves them all!

- Improve network health without touching the network infrastructure
- Dynamic bandwidth throttling in the most volatile scenarios
- Visualize and analyze endpoint security and app telemetry in real-time

### Features

Automation - fully customizable via WMI/PowerShell

Intelligent Bandwidth Management - measurement and management for WAN/LAN/SD-WAN/Internet breakouts

Troubleshooting - includes Remote Tools to assist with support troubleshooting

Dashboards - beautiful dashboards to monitor all download activity in real-time

Geo-Mapping - integrated geo-mapping of all StifleR networks and endpoints

### Business benefits

- ✓ Use all available bandwidth without impacting business traffic
- ✓ Force business priority – deploy Windows Security Updates faster etc.
- ✓ Simplify the infrastructure – reduce the infrastructure required, remove all dedicated support systems in remote branches
- ✓ Reduce network/cloud data egress costs – reduce network traffic
- ✓ Improve the network health without touching the network infrastructure

### Who we are

2Pint – like the fun uncle or aunt that sometimes came to visit. Somewhat nerdy, super practical, painfully honest, notoriously hardworking though. Independent, not because we don't want to be social, but merely because we want to have the right to say what we think and do what we know is right.

### What we do

2Pint Software was formed in 2014 by us, Andreas and Phil. We produce software to help organizations build better infrastructures. We are the world's experts in peering of content, network observability, OS build and health tracking for both Windows and Linux.
