Why migrate to Dynamics 365?

Built on the Dynamics 365 ecosystem

Unify your data. Get predictive information.

Achieve impressive results.

Modern Unified

Intelligent

Power platform

Adaptable

Migration to the cloud offers an advantage

Real-time visibility of your business

Automatic backup and restore

Enable flexibility and scalability

24/7/365 SLA

Access other Microsoft solutions like Azure IoT & Power BI

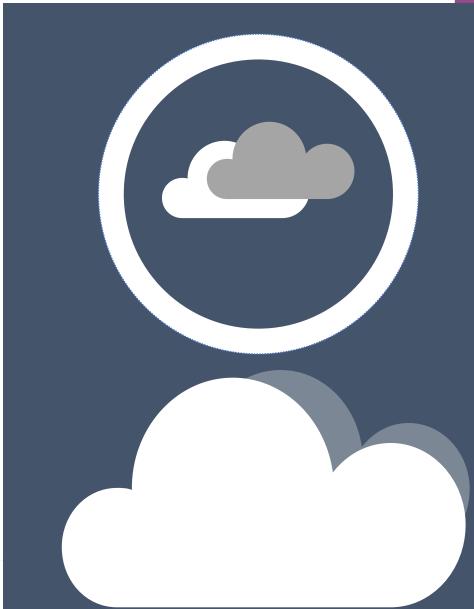

Improve security, privacy and reliability with Azure Cloud

Permanent updates

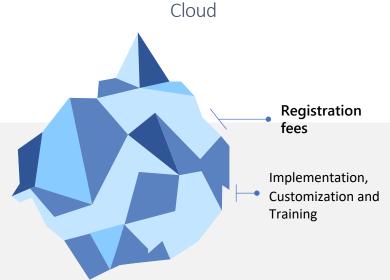

Increased productivity, speed and innovation

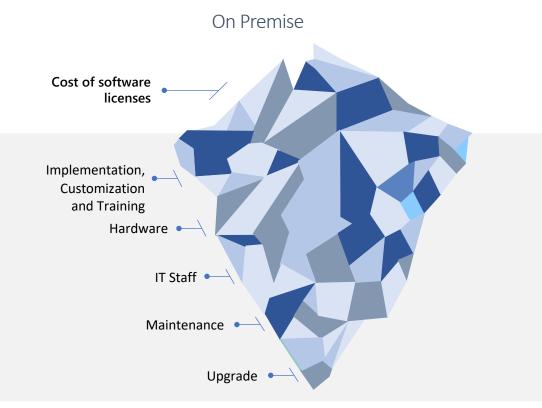

Lowering the cost of ownership

Dynagile Consulting

Cloud vs. On Premise

- Registration fees
- Training
- Configuration
- System Administration

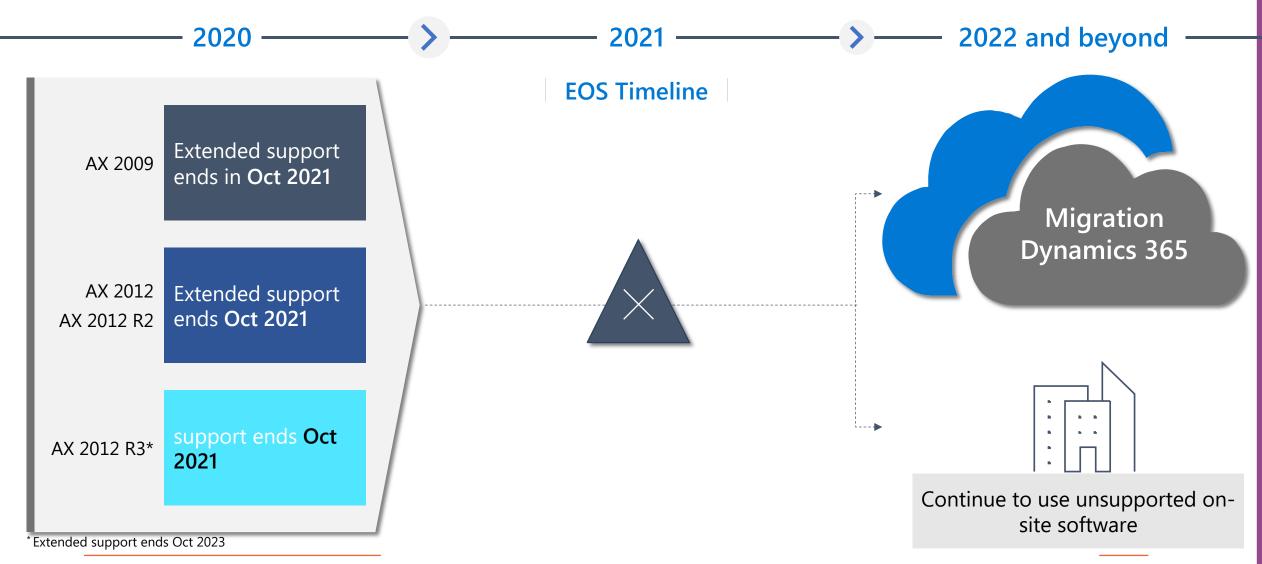

Ongoing Costs

- Patches and upgrades
- Downtime
- Performance to be optimized
- Customizations
- Integrations

- · Constant updating of applications
- · Permanent workload for IT
- Maintain/update network
- Maintain/update security
- Maintain/update database

AX customers face end of support

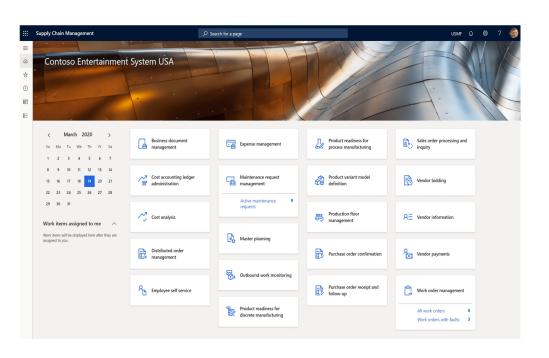

Migration D365

Why Migrate from AX 2012 R3 to D365?

A new cloud-based solution that offers:

A SaaS solution

Many new features

A regular evolution

A full web interface

An integration with the Power BI platform

• • •

And to compensate for the obsolescence of your version and the end of support.

This project is a **real change**:

Technical: we are moving from On Premise to the cloud. it's a cultural change. Lifecycle of the solution: regular new versions that will require new processes. Usage: a more modular product, less monolithic and more easily integrated into its ecosystem.

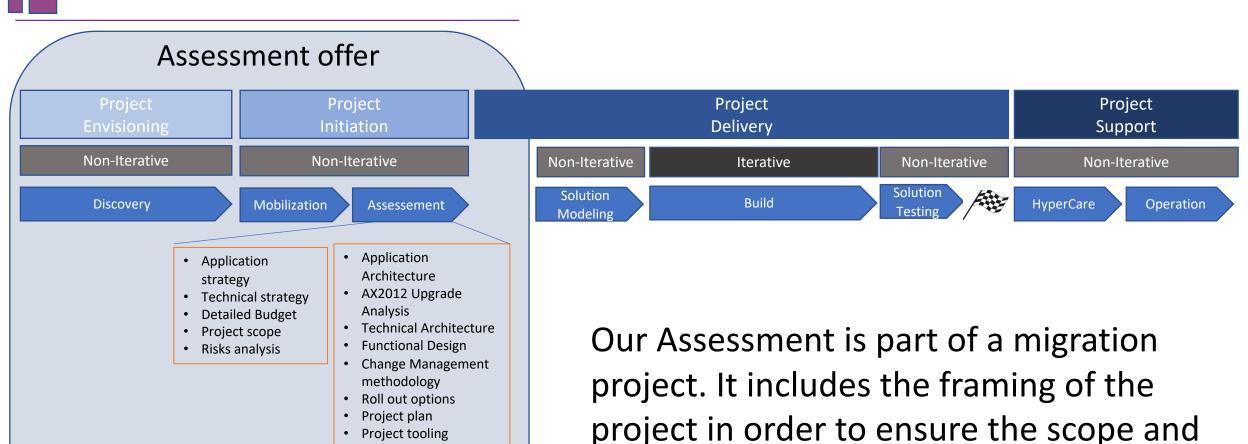

It is not a simple technical migration!

Our Assessment Offer

Methodology

its impact in your eco-system.

Governance

implementation

Assessment

- Identify the list of major specific developments.
- Define the precise scope of the project: geography, functional, technological bricks.
- Define an application architecture diagram on what will be included in the scope: Azure Resources, Interfaces, BI, Reporting, PowerApps,...
- Interfaces Migration
 Impact

- Define an initial technical architecture diagram: Link with the group's infrastructure, Azure interfaces, use of Synapse, Data Lake,...
- Identify a first impact analysis on the infrastructure: Citrix platform, BI platform, ETL platform,...
- Identification of gaps that can:
 - Migrated
 - be developed outside of F&O (PowerApps,..)
 - Be covered by an F&0 refactoring development

- Perform a risk analysis
- Identify a budget including License, Azure and Integration costs.
- Identify deployment options.
- Identify a project plan.
- RACI

- Inventory of reports.
- Security description:
 Securing the platform and its accesses.
- Description of the management of the solution's life cycle in run mode.
- Definition of the development platform: LCS, Azure DevOps.
- Description of testing methods: automatic tests
