synthet^{ai}c

Detect anything in minutes without labeled data.

What if anyone on your team could build a detection Al from a single example in five minutes?

RAIC lets you find anything in minutes, solving AI's underlying speed-to-insight problem and unleashing the power of Al in your business.

This end-to-end offering provides insights through rapid search of unstructured satellite, video, and image datasets without time-intensive human labeling or expensive labeled data troves. RAIC removes the barriers to practical Al.

RAIC gives you the power to:

- Immediately find anything in your unlabeled data.
- Train and fine-tune AI with speed and agility.
- Get insights like a machine learning engineer whether you are one or not.

Learn more about the problems your company can solve with RAIC.

IMAGE

Using a single source image, RAIC will find anything, no matter how rare, across an entire unlabeled dataset in minutes.

Starting from a Bing image of a zebra, RAIC was able to quickly identify zebras in months of unlabeled imagery captured in the field.

FMV

RAIC will help you find objects in thousands of hours of full-motion video with ease, keeping you ready to address the unknown unknowns.

RAIC searched unlabeled drone video for all matches to a description of a suspicious vehicle.

GEOSPATIAL

Unlock object detection or classification insights in minutes from massive amounts of unlabeled earth observation satellite imagery, including both RGB and SAR.

Climate Trace used RAIC to find and classify CAFOs across several US states and other countries, an unimaginable feat if done by human labeling alone.

No-Risk, Ultra-Fast Iteration

RAIC enables users to find and classify anything in minutes, not months, without labeled data. Simply provide a single example object image and RAIC will find similar objects in your unlabeled dataset and return contextually-related results. You can then improve the AI by identifying the best results through an intuitive human nudge tool. From there, you can run inference jobs and turn results into insights using dashboarding tools or existing analytics platforms.

INSTANT DETECTION OF ANYTHING, AT SCALE

About Us

Synthetaic's vision is to fast track the world's transition to practical Al. We build tools that remove the speed-to-insight and human-labeling barriers found in traditional Al development. It's the way Al is supposed to work.

Synthetaic was founded in 2019 in Delafield, WI by Corey Jaskolski after his work to help save the endangered Sumatran rhino inspired him to reimagine the limits of AI and data. Our solutions have been applied to critical use cases across industries, including geospatial, defense, security, science, technology, conservation, and more.

We've worked with Climate TRACE to identify CAFOs (concentrated animal feeding operations) to help them estimate methane emissions, the US Air Force to rapidly extract key insights from geospatial data, National Geographic to help identify and track rare species to safeguard against poaching, and many others
