

External Penetration Testing

External Penetration Tests are designed to simulate attacks against an organization's network edge. *Are you secure?*

External Pen Test

- Purpose - Simulates attack against an organization from an attacker on the Internet
- Goal - Obtain credentials, penetrate network perimeter, gain access to services and sensitive data
- 100% remote, no customer setup or involvement required before or during the test
- Pricing is based on attack surface size (number of active external IP addresses)

Internal Add-Ons

- External Vulnerability Scan - Port-based automated scan with commercial tools (Nessus Professional)
- Web Application Vulnerability Scan - Sentinel can conduct a comprehensive web application vulnerability scan with a commercial tool (NetSparker), which is designed to uncover common web app vulnerabilities including things like Cross-Site Scripting (XSS), Cross-Site Request Forgery (XSRF), and SQL Injection vulnerabilities.

All Pen Tests Include

- Dedicated Project Manager
- Fully detailed deliverable report with remediation recommendations at the conclusion of the project
- Detailed WebEx presentation of the full report by the penetration tester at the conclusion of the project or during the test
- Pricing is based on attack surface size (number of active external IP addresses)

“We get Pen Tests every year and Sentinel’s test results and report was more impressive and thorough than any we’ve ever seen.”
