Schools are failing to deliver STEM education

McKinsey Global Institute estimates:

New technology will yield new types of jobs

Between 400 million and 800 million of today's jobs will be automated by 2030.

Code.org report says:

Global economies require more programmers.

Only on the US job market to 2020 will be more than 1,000,000 jobs gap for computing jobs.

Gallup report says:

Schools adapt STEM education too slow.

Only 35% of high schools teach programming. On the lower stages of education is much worse.

The big opportunity for EdTech solutions: Smart Education and Learning Market will grow from \$105.23 Billion in 2015 to \$446.85 Billion in 2020. (global forecast at a Compound Annual Growth Rate (CAGR) of 24.4%)

Complex issue

Global economies require more programmers

Schools adapt STEM education too slow

Schools fail because they lack engaging tools

Challenges of modern education

Challenges

- Educational institutions need to implement STEM curriculum as fast as they can
- Lack of teachers with knowledge about new technologies

Ideal solution

- All-in-one STEM tool
- Easy to adapt for non-technical teachers
- Explaining materials for teachers in multiple languages

Desired outcomes

- Ability to teach students about new technologies, coding and AI
- Increase the educational level of educational institutions

Challenges (proof)

- Only 35% of Highschools teach coding
- Increasing gap between the number of jobs for engineers and number of qualified employees

Ideal solution (why clients need this)

- Limited budget for buying multiple solutions
- Non-technical teachers have no skills to use advanced solutions
- Non-English countries have troubles when using English-based tools

Desired outcomes (proof)

- Educational institutions are obligated to follow national curriculum standards that consist of STEM subjects
- Better educational offer increase attractiveness of educational institutions for clever students and their parents

Complex issue needs a **complex solution**

Coding lessons made easy
no coding experience required

Suitable for kids of all ages
from kindergartens to high schools

Compatible with most tools & devices
available in home or schools

Ready out of the box
no configuration required

Worldwide community of teachers
creating scenarios for all levels of education

Photon teaches children how to:

- **think** logically,
- **solve the problems** in many creative ways,
- **code** using new technologies and sensors.

The most universal STEM didactic tool

Ready-to-use
tool

Preset lesson plans
and examples for teachers

**Kindergarten
Preschool**

(PRE-K / ISCED 0)

**Primary School
Elementary School**

(K-5 / KS 1-2 / ISCED 1)

**Middle School
Secondary School**

(K-12 / KS 3-5 / ISCED 2-3)

PRE-K approach

Aims

- Visual-motor coordination and manual skills,
- Spatial orientation, determining direction skills,
- Planning, anticipation and understanding the logics of 'step-by-step' events
- Algorithmics (activities recurrence)
- AI introduction

Recommended tools

Photon EDU

Photon Coding

Photon AI Junior

Recommended devices

Mobile

Interactive floor

Interactive board

Coding - PRE-K approach

Photon Draw (4+)

Photon Draw was designed for the youngest. Even 3-4 years old children are able to program by drawing a path with your finger on the screen.

Develops in children:

- ✓ Manual skills
- ✓ Spatial orientation
- ✓ Understanding the logic of events

Photon Badge (5+)

Photon Badge was created for children who can understand more complex logical sequences. We design a robot program using simple instruction symbols.

Develops in children:

- ✓ Spatial imagination
- ✓ Planning, anticipation
- ✓ Algorithmics (repeatability of activities)

AI - PRE-K approach

AI Introduction in Kindergarten focuses on finding patterns, unique features, simple encryption. Children can use their hand drawings and use AI to recognize them and control Photon

K-5 approach

Aims

- Understanding of new technologies, programming in script language
- Ability of matching systems and environments, multi-aspect comprehension
- Computation thinking – a process of finding solutions to open complex problems
- Ability of creating the same outcomes in different ways
- Basic AI creating skills – creating models, image, text and speech processing

Coding - K-5 approach (1/2)

Photon Blocks (7+)

Photon Blocks are designed for children who can already read. At this stage of development, by arranging colorful blocks of instruction, children are able to understand what complex operations are.

Children develops skills in:

- ✓ Creating complex programs
- ✓ Optimization of written programs
- ✓ Early detection of errors

Photon Code (10+)

Photon Code introduces children to the world of real programming. The interface is in English, it resembles the classic code in the console. Children uses ready-made blocks of text to create their programs.

Children develops understanding of:

- ✓ The structure and syntax of the programming code
- ✓ More advanced algorithms
- ✓ Programming with the use of sensors

Coding - K-5 approach (2/2)

JavaScript

AI - K-5 approach

The screenshot displays the Photon AI application interface, divided into two main sections: "Photon AI" and "Photon's Memory".

Photon AI: This section contains two primary options: "Train your Photon" (represented by a brain icon) and "Code with new blocks" (represented by a robot icon).

Photon's Memory: This section shows a grid of categorized blocks for programming. Each category includes a label, a "2 more to start!" indicator, and several visual examples of the objects being recognized:

- w lewo:** Left turn blocks (yellow, grey, green, red, yellow).
- jabłko:** Apple blocks (red).
- prosto:** Straight blocks (red, black, green, purple, green).
- kubek:** Cup blocks (white, white, white, white, white).

On the right side, there is a "Choose object:" dropdown menu with options: teddy bear, apple, photon, ball, dog, controller, and computer. Below this is a "visible" toggle switch. To the far right, a portion of a block-based programming sequence is visible, including "Start", "Go ahead 20 cm", "Go back 100 cm", "Turn around 60", "Wait", and an "If" block.

Photon AI (alpha, closed tests):

Photon AI application is a tool that teaches block-based programming with the usage of AI tools. Application uses Microsoft Cognitive Services to detect different objects and then program the robot to react on these objects by analyzing the camera images.

K-12 approach

Aims

- Complexity and possibilities of code syntax knowledge
- Multithreaded programming skills, event-driven programming
- Creating advanced software with use of various systems
- Data science, AI and cloud architecture modules creating skills

Why customers should choose Photon?

The most technologically advanced STEM didactic tool within its price level

Compatible with mobile devices, computers and other hardware

The most available integrated coding tools

EN, PL, GER,
CZ, SK, SW

Teaches coding and AI in native languages

Universal for various age groups

Ready to use out of the box, no configuration or tech background required

Does not require adult's support

Adjusted to group work.
Non 1:1 approach.

Testimonials

„Working with Photon is like mind gymnastics. On the one hand... schematics. We need to be very precise while providing information. On the other hand... we look for new creative solutions. Thanks to the fact that children transform a symbolic code into real action, they can pay attention to details, which is very important when preparing them to reading and writing. Coding is very stimulating for imagination”

Katharina Dardzinska, Pre-school educator

„Students are willingly using Photons during classes and these are not only extra coding classes but also obligatory school activities. For example we actively use our robot during maths lessons. Nowadays, when technology is everywhere around us and affects our space, I, as a headmaster cannot imagine that children would not benefit from such technologies as robots.”

Slawomir Radecki, Principal of Primary School

Photon + Microsoft services

Joint Microsoft and Photon solutions provides implementation of the newest technologies and STEM curriculum to every school.

Coding in early and primary education

Photon Microsoft MakeCode coding platform.
Didactic materials in OneNote on the online web platform (Azure cloud)

AI curriculum for kids

Set of AI tools (connected with lesson plans) for Kindergartens and Primary Schools, based on Microsoft Cognitive Services and Azure Cloud.

AI curriculum for students

Set of tools connected with projects for Secondary Schools, based on Azure IoT Hub and Azure Cloud
