

GUARDRAILS

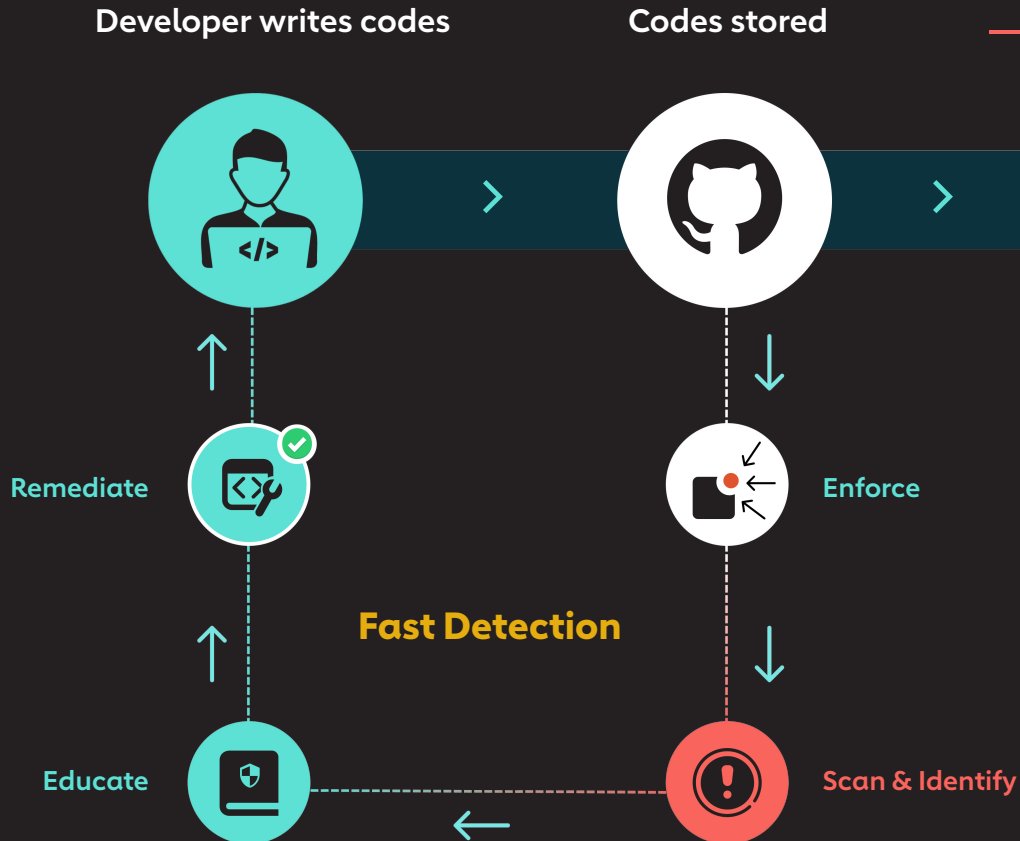

An end-to-end security solution that integrates with your current environment and provides instant feedback.

Historically, **Security** teams have been a process bottleneck because they have to fix issues introduced by **Software Developers**.

GuardRails speeds up the **Application Security Lifecycle** by empowering software developers to fix issues directly and keeping security teams in the loop.

Our Approach

We integrate seamlessly with your current structure and we only alert developers of critical vulnerabilities to reduce noise.

Detecting issues early on in the development process is what we help do.

We empower developers to detect, prioritize and fix issues themselves so it doesn't have to be a hurdle for deploying on time.

Why GuardRails?

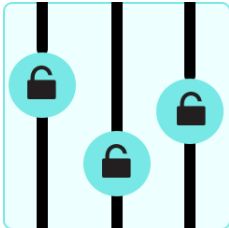

Today, the only thing that has shifted left are the vendors, the tools, and the process. What hasn't, is the people in the process.

Identify critical issues and learn to fix them early

Reduce noise and distractions and be alerted only by critical issues

Eliminate security as the bottleneck of the development cycle and release features faster

Be guided by the exclusive JIT Training where developers learn as they code

Seamlessly integrates into your current workflow without adding processes
