

Data Traceability Watcher

Allows visualize the KPIs (key performance indicators) of information traceability to improve the data governance of your organization.

Data Traceability Watcher allows, through dashboards, to visualize the KPIs (key performance indicators) of information traceability to improve the data governance of your organization. It contains metrics to monitor data from the source, transformation and storage in the exploitable destination, adapting to different methodologies such as DAMA and Data Vault and including Azure data services architectures as Data bricks, Synapse Analytics, Azure Data Lake Store, Azure SQL database, Azure Database for MySQL, and more.

It can show indicators such as execution times, number of transferred rows, number of duplicate data, reprocesses, among others.

"The control model of this solution provides the necessary detail to know the status of the process in a reliable way ..."

– Government customer

This solution has:
key performance indicators that are of general interest for the traceability of data in different business scenarios as part of the solution core.
