

Trust Container

Move & Modernize

Easily move your legacy or on premise applications to a container scheme.

Trust Container is a methodology that allows clients to carry out successful migrations in an orderly, understandable and safe manner with the confidence of considering all the elements involved with their system and at the time of testing all the requested requirements are met.

Its main features are:

Trustworthy. Incorporating an analysis and design stage that allows to adequately define the key points to be executed.

Flexible. Accepting different target container environments such as Dockers, Red Hat or Kubernetes.

Transparent. With the creation of architecture diagrams that allow knowing the final state of the created environment.

Safe. With the implementation of a battery of tests that ensure the correct functioning of the system
