

Hyper-secure Portals

Our hyper-secure portals provide a secure and private space for your customers to upload sensitive documents or conversations. Dropvault portals are conversational and not just for documents so your customers can discuss and share knowing their discussions are private and secured

- Private portals for conversations and document sharing
- All messages, replies and documents encrypted with a key unique to your business
- Portals are bi-directional and team focussed
- One-time auto expiring magic links or long-lived links with a PIN/Password
- Password-less team access to portals for friction-less sharing
- Encryption and privacy by default but no key sharing required
- Dropvault or customer provided key vault
- Dropvault or customer provided Azure/AWS/On premise document storage
- Dropvault or customer provided email server
- Full auditing and activity reporting
- Customize your portal with logo, welcome message, support links and contact phone number

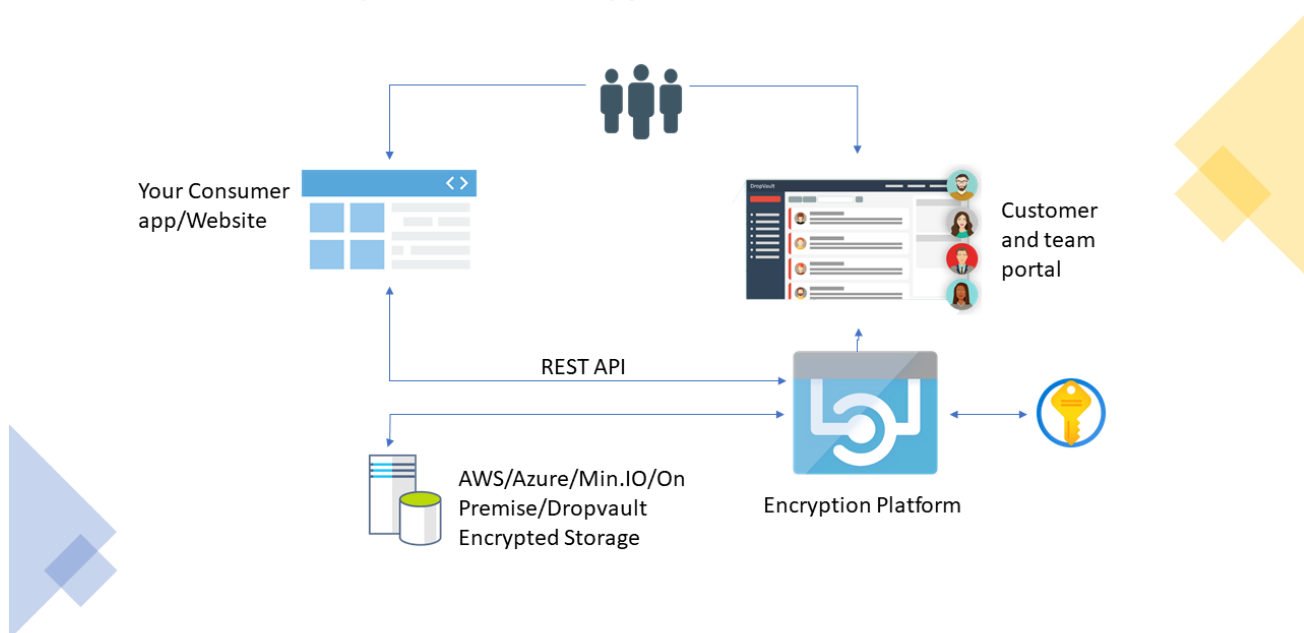

Connect your App to our API

If you have a consumer app or website you can connect your app to our API. Add a new contact, upload documents, encrypt and store, or trigger a portal link to your customer, all from your own business app.

Your customer remains in your app and has the best possible user experience, but we do all the heavy lifting and ensure that their documents are always secured.

Dropvault - Encryption as a service

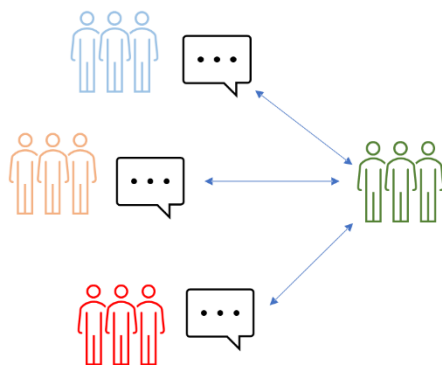

The API connection can be used standalone or alongside the interactive customer portals for a flexible solution. Roll out our interactive portals and then transition to the API when ready.

Using our API ensures that all uploads are always secured – We manage the uploads, key management, encryption and access to these documents for your team plus your customer can use our portals to update or message at any time.

B2B Channels for trusted connections

Link businesses together with trusted connections. Our B2B channels allow secure and private collaboration and document sharing between any number of teams, including other businesses already on Dropvault

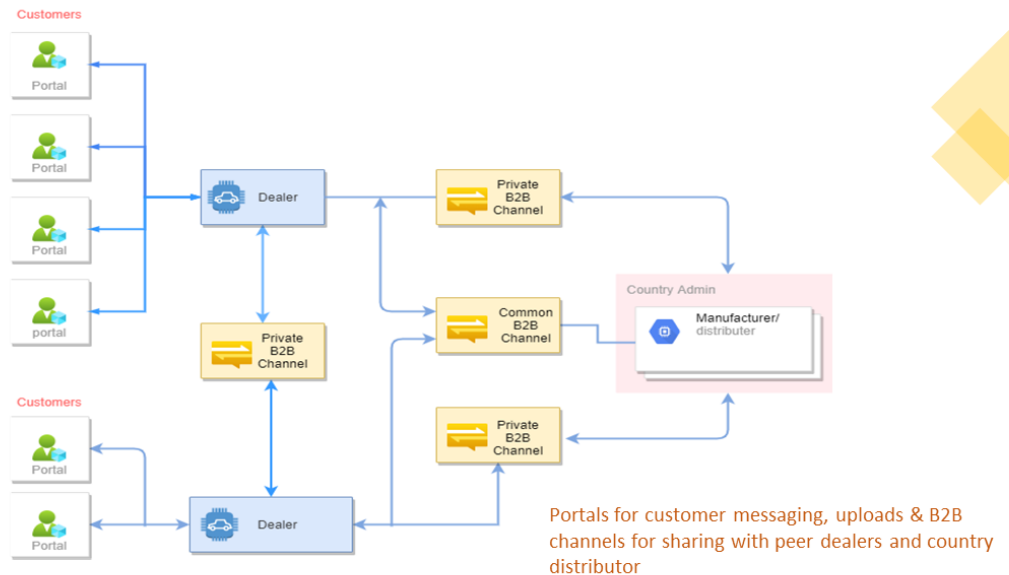

- B2B Channels for sharing privately with internal teams
- Or with multiple teams in a business
- Share with an external single contact or an entire customer team
- Each B2B channel encrypted with an individual 256 bit key
- Choose access level for each team or contact
- Support for Access Lists and roles
- MFA including Biometric authentication
- Dropvault or customer provided key vault
- Dropvault or customer provided Azure/AWS/On premise document storage
- Full auditing and activity reporting

B2B channels provide a secure and private connection to another team or another business without having to use insecure email. Documents and messages stay within the channel for maximum privacy.

Combination of Portals & B2B Channels

Or combine portals and B2B channels to provide end to end secure collaboration and sharing with anyone, inside or outside your business.

Securing customer documents in a car dealer network

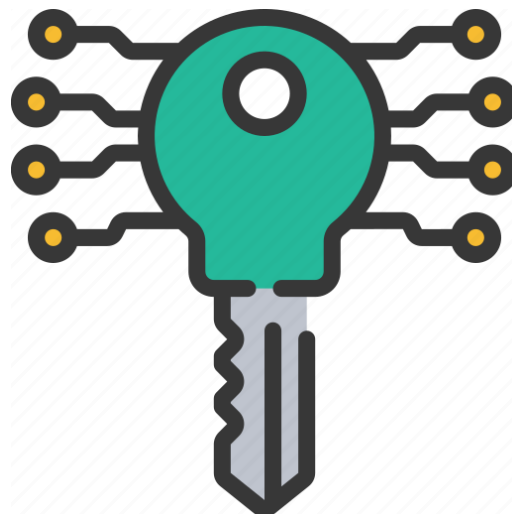

This combination provides a free exchange of documents and messages across an extended organization while ensuring that sensitive content stays within the network secured and private.

All Dropvault portals and channels are full featured with replies, action items, auto deletion of messages and documents, PDF watermarks and passwords, bookmarks, reminders and task manager.

Hyper-secure Key Vaults

Hyper-secure web hosted key vaults for hot crypto-currency or encryption key storage

- Hyper-Secure. Some of the most secure vaults available anywhere
- Non-Custodial. Dropvault has no access to the vault password/pass phrase
- Unique and strong encryption key per vault for privacy and isolation
- Web hosted for ease of access and flexibility
- Enterprise level security and encryption at consumer price point
- Multi-user for redundancy. Our vaults support multiple team or family members, so access is always assured
- Anonybit Biometric authentication as standard plus phone authentication, trusted locations, access levels and much more
- Multiple vaults per account with custom access to each
