Shift Underwriting Risk Detection

Risk Detection Made Better for Underwriters

Let underwriters make better decisions about potential misrepresentation, fraud, and other policy risks across the life of a policy. Built on the Shift Insurance Decisioning Platform, the Underwriting Risk Detection product is powered by AI to help underwriters mitigate fraud, optimize pricing, and spot policy risk trends like agent gaming in the portfolio.

The Situation

The digital insurance era has brought fierce competition. Customers expect to complete quotes and policies in seconds on their smart devices, with mobile insurance app usage growing 26% in 2021¹. Underwriters must accelerate their decisions, satisfy digital customer expectations, and continue growing the portfolio.

This pressure comes with a challenge: insurers lose an estimated \$50 billion USD in premium leakage², with 14% of adults willing to make false statements to lower their premium rates³. The concern is clear: 57% of insurance leaders believe fraud impacts their brand reputation, while 54% worry that fraud will force them to slow customer acquisition⁴.

Underwriting organizations try to either spot fraud quickly with basic business rules and data checks, or slow the underwriting process with manual investigation (which can cause customers to abandon the application process). Both methods continue to miss sophisticated fraud and misrepresentation techniques, accumulating risk in the portfolio.

The Solution

Shift Underwriting Risk Detection is an AI-based SaaS product designed to let underwriters quickly and accurately detect risk. This solution helps underwriters mitigate fraud, optimize pricing, and spot policy risk trends in the portfolio.

Shift's approach solves for the key barriers that prevent underwriters from detecting premium leakage and fraud with speed and accuracy. Instead, underwriters can accelerate with confidence, growing the portfolio without the risk of lost revenue.

Shift's AI solution can uncover a comprehensive range of premium leakage and fraud, including fraud networks and agent gaming risks. Shift AI detection aligns to key underwriting decision points, providing real-time detection during policy quotes and applications, daily analysis for new business, or scheduled analysis during mid-term and pre-renewal reviews.
