01 Value drivers

- > It's important to understand how and to what extent dashboards are being used in your organization as it will demonstrate the impact of data & insights. Furthermore, it will help you prioritize efforts to maximize business value.
- > During this **5-day journey** (ref. default set-up) we implement an advanced logging and monitoring solution, to analyze the daily Power BI usage in your organization. Important to note, this is an extension and solving the limitations of the out-of-the-box usage monitoring, available through the Power BI service.
- > Key-benefits of the proposed solution:
 - > Every detail is logged automatically and available for analysis (as long as required)
 - > The reporting solution is using Power BI, which supports row level security and custom measures
 - > Centralizes the usage activity across all the workspaces
 - > Enables wider trend analysis because historical data is kept
 - > Captures a wide range of activities: not just views but also bookmark subscriptions, exports to excel, API calls, ...
 - > Rich data model with additional information about connectivity, distribution types and consumption methods
 - > Standardized dashboards can be deployed immediately (ref. demo), possible to customize dashboards that focus on specific value drivers

02 Investment

Included in default-setup - €5.000

1. Request access and deploy Azure resources
2. Configure script to capture all relevant events
3. Set-up of 3 standardized monitoring dashboards (ref. demo)

Optional (price on request)

4. Customization and/or additional monitoring dashboards
