

Modernizing Traditional & Legacy Apps (MTLA) – Assessment Program

Are you struggling to upgrade your traditional applications and databases? Is legacy application limiting your business agility? Are you having hard time maintaining your outdated Applications?

There are many ways to modernize your applications, from integrating existing systems with APIs to doing a full rip-and-replace of infrastructure and building an entirely new application architecture with cloud computing. However, many businesses see Application Modernization as an overwhelming and needlessly complex process, causing them to miss out on the benefits it offers.

We at Applab believe that by taking advantage of the Azure Cloud technology and modernizing your traditional and legacy applications can introduce more flexibility and scalability, and make your business more agile and productive, providing a better customer experience for those you serve.

The Application Modernization Assessment is an in-depth process that can be divided into a series of stages:

Strategy and Plan Workshop

Discuss your high-level business objectives and application estate strategy.

Data Collection and Analysis

Collect app estate data and verify it against business objectives.

Categorization Workshop

Rationalize app portfolio against 5 R's (Rehost, Refactor, Rearchitect, Rebuild, Replace).

Modernization Priority Identification

Identify up to five applications for deeper code level analysis and migration/modernization planning.

Final Recommendation Presentation

An overview presentation and detailed set of reports that include our results, recommendations, and next steps, including a deployable reference architecture and migration plan for selected apps.

As an investment in its key customers, Microsoft and a partner are sponsoring the application modernization assessment to help businesses like yours take advantage of the benefits of today's customer-centric technology. The assessment is a two to four weeks process in which Microsoft and a partner rationalize your application portfolio and identifies up to five of business-critical applications for deeper analysis.

Application Modernization

FAQs:

How many apps will we assess?

The number of apps assessed will depend on your customer's specific situation. You will discuss this during the initial scoping call.

What factors does the assessment take into consideration?

The MTA assessment will cover the customer's:

- ✓ Current application architecture
- ✓ Application complexity and dependencies
- ✓ Application cloud readiness (hybrid or full migration)
- ✓ Security landscape
- ✓ Application server & databases
