

Wrong-day irrigation

Smart water conservation for utilities in regions with severe drought.

Periods of **severe drought** are increasing in numerous US states and throughout entire regions. This illustrates the urgent need for **water conservation measures** to avoid costly investments in additional infrastructure.

Utilities can implement drought contingency plans to restrict irrigation to specific days and time windows, but customers may ignore them or may not be aware of them. Detection and follow-up on these restrictions are in many cases very manual and labor-intensive tasks, too, making the process even more challenging to utilities with already busy staff.

Water conservation made smart and simple

- ✔ **Lower peak demand** and **combat wasteful water usage**, without burdening your staff.
- ✔ **Automate reporting** and the enforcement of **regulations**.
- ✔ **Educate** and **engage** with your customers based on their actual consumption patterns.
- ✔ **Reach** your sustainability goals.
