File Oversharing Analysis Tool

PRIVATE AND CONFIDENTIAL – © INVERO – DO NOT DISTRIBUTE WITHOUT WRITTEN PERMISSION

What is File Oversharing?

- Data shared using "People in *<Organization>*"
- Creates a link in SharePoint/Teams that grants everyone in the organization access to files/folders
- Even if specific names are entered into Sharing dialog

- Problem:
  - With Copilot for Microsoft 365, this now means that data could be surfaced in generated responses because the user technically has permissions to the data even if they can't find the data without knowing the link

TMI – Too Much Information

- Solving the oversharing problem with a tool that analyzes all data across your entire M365 tenant in only 3 Steps

    1. TMI scans every SharePoint and Teams object in your tenant
    2. TMI interactive reports allow you to analyze the results to identify high risk overshared sites, folders, files
    3. Optional: TMI can be used to remediate all or some of the overshared sites, folders, files
        - Remediation removes overshared links and replaces with new individual sharing links for the intended user(s)

- First party tools in SharePoint only provide reporting on oversharing that has occurred in the last 30 days and do not have an automated remediation process available

TMI by invero

Overshared folders are defined as folders that have been shared with a link that is accessible to everyone in your tenant, thereby making the permissions on any files included in that folder and subfolders visible to Microsoft Graph and in turn M365 Copilot. These sharing links bypass site level and group permissions that are in place.
