# Djeeni

**Personal data processing automation platform in Excel**

# Can we help?

Automation means for most companies large IT solutions under control of centralized IT. One of the goals is to replace Excel.

"They say I must completely get rid of Excel. I cannot see that they are right."

Most of the time, large IT/Data projects end up leaving 15-25% of the non-critical scope behind. Users fall back using Excel manually or with custom automation.

Native automation in Excel has some disadvantages:
- Custom solutions, not supported, not documented
- Not auditable
- Macro or other coding knowledge required

**Djeeni is the data automation app for the left behind processes in Excel eliminating the above drawbacks.**

# Djeeni works like your assistant

Djeeni is built with the challenges of the Excel user in mind:

- Repetitive tasks to gather information / create reports / administer custom processes
- Simple, but time-consuming manual actions

You can explain your tasks to Djeeni as to a junior colleague, in human language. No coding required.

Then Djeeni executes these tasks:

- No human erros ... uhm, errors.
- Not sick, not on vacation, not out of office, not leaving the company

"Again month-end close. Working late to create all management reports."

# Djeeni keeps your secrets

"Our reports are confidential. **Must** stay with us."

- Unlike other solutions, Djeeni does not take data away for processing. All processing happens on the user's computer.

- Djeeni works on behalf of the user with their user rights to access files and data sources. If the user has no access to a location or system, then Djeeni will not be able to access it.

- By using Djeeni, there are no data security and confidentiality issues.

# The 1-day, self-service, Djeeni project

⊘ General purpose data tools are not easy to learn. Beginners' courses take days and further experiencing weeks. Just then you can start to work with the tool.

$ Data projects involve external consultants; lot of discussions between users and implementors; rigid settings. Also, involves lot of money and extended duration.

🗎 With Djeeni, you can
- Yourself start using Djeeni at 9AM; and
- Be ready with the automation of your first process by 5PM
- Change and improve it anytime, quickly, yourself

"A new tool **again**. No time to learn."

# Valuable, auditable

"The guy, who wrote this macro, has left the company. Cannot change it anymore."

Every Djeeni process is
- self-documented,
- independent from developer and code,
- becomes a long-term asset of the company
- fits into the Microsoft eco-system (Dynamics, Power Automation, Power BI)

Execution of a process is also well-documented and auditable.

# How to get it?

You can try out Djeeni for free:
https://www.djeeni.com/djeeni/getdjeeni

For small offices you can get a flat price, per user license.

For enterprises there is a role- and usage-based license construction.
