

Learner Management System

Our LMS is the most flexible system to manage, monitor and use for both learners and employees.

Our system is modular based with core modules

- Student/Employee Management Module
- Company Wellness Module
- Workforce Transformation Module

Benefits of our LMS

Every business uses processes to run their operations. From ordering stock to selling a service to assembling a product, each employee, system, or intelligent asset needs to follow a collection of steps to achieve a favorable outcome.

By controlling the way that these processes are performed, your organisation can:

- Decrease its operating costs by reducing expenses.
- End unapproved and irresponsible spending.
- Increase the quality and speed of its service delivery.
- Collect and store accurate relevant data for statistical analysis and reuse.
- Standardise the output of products and services to ensure compliance and quality requirements are met.
- Reduce the risk of fraud, human error, non-compliance, and reputational damage.
- Accelerate employee onboarding, ensuring that new personnel are trained up, productive, and following the correct procedures in minimal time.
- Adapt to changes more efficiently, allowing it to outperform its competitors and take advantage of new opportunities in the market.

Business processes can be difficult to control, but thanks to ongoing innovations in technology there are tools available that are designed specifically to help busy organisations to run smoothly. FlowCentric Processware is one of these key tools.

Use FlowCentric Processware to convert your unique business processes into the applications that your organisation needs to thrive.

Why Our LMS

Increase operational efficiency by digitising the unique business processes that make it so successful.

- Automate and manage the complex workflows that span across systems, departments, customers, suppliers, and regions.
- Control when and how each step in a process is executed and by whom.
- Gather data from various sources and present the information to users in a single interface.
- Securely connect people to the company's processes and data through various devices such as computers, tablets, and smart phones.
- Automatically initiate processes based on data received from sensors, emails, and documents.
- Implement companywide process changes with minimal change management or interruption to daily operations.
- Ensure that tasks are completed accurately and in time, keeping users informed during each step in the process.
- Set up escalation and routing rules to ensure that work never stands still and that service level agreements are met.
