Continuous Cyber Risk Analysis

Our Risk Principles & Innovations

BreachRisk™ Score is designed from the ground up to support boardroom decision making techniques, with data via direct hacker tradecraft.

- **Risk = Likelihood x Impact**. BreachRisk™ Score answers the question, "*what is the relative risk that a cyber breach will occur to this organization in the foreseeable future?*"

- **CVSS Compatible**. BreachRisk™ measures threats far beyond the NVD with active attack methods and incorporates the CVSS standard to characterize all threats in a way that is coherent and compatible with other common cyber risk metrics.

- **The Hacker's Perspective**. BreachRisk™ emulates attackers. We measure alignments of opportunity + capability where a hacker's breach is likely. An opportunity only influences risk if there is a capability to exploit it. So unlike other methods that punish your team for every *theoretical* weakness, you'll get credit for compensating controls.
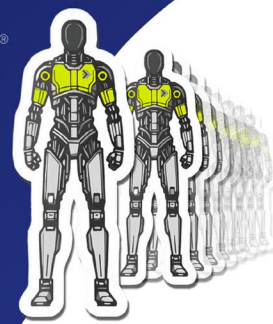

BreachRisk™ Portfolio

Discover and track the BreachRisk™ Score of other organizations.

When you need to understand the risk of a cyber breach for an organization other than your own, you need BreachRisk™ Portfolio. Designed for less-technical decision makers managing risk pools and for efficient, standardized cyber due diligence.

Predict cyber breaches at companies that affect your bottom line.
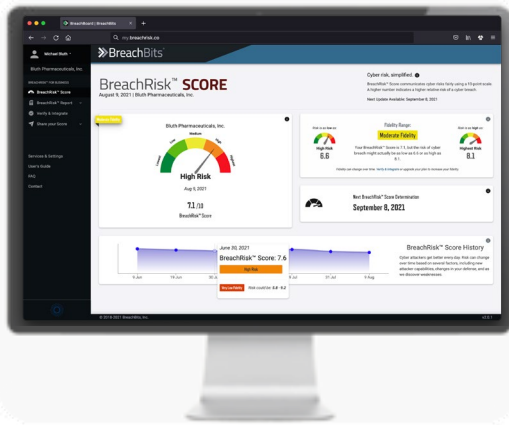

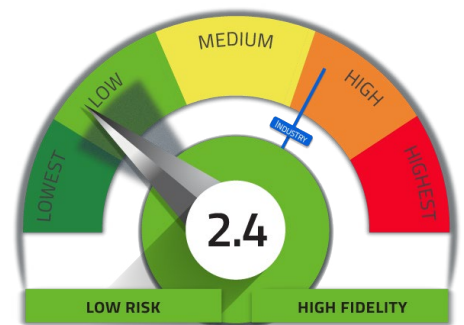

Insight to enhance performance

Imagine a credit score... but for cyber risk. Accurate, efficient, scalable cyber risk scores will change the way you do business and give you a competitive edge. BreachRisk™ Scores are easy to understand 10-point scale and allow you to compare different organizations and make risk-related decisions easier. And if you need deeper insights, BreachRisk™ Report provides the "why" - so you can easily understand those risks.

- Cyber insurers
- Cyber due diligence
- Venture capital investors
- Managed Security Providers
- Accounting firms
- Supply chain risk

Our Methods & Innovations

BreachRisk™ Portfolio is easy to set up with nothing to install. **All you need is the name and website of the organization you want to track.**

- **Want the truth? Ask a hacker**. We know the risk of a breach because we are a team of military veteran hackers. We emulate attack tradecraft with automation and Artificial Intelligence, and our BreachRisk™ Score is based on our ability to breach an organization.

- **Risk = Likelihood x Impact**. BreachRisk™ answers the question, "*what is the relative risk that a cyber breach will occur to this organization in the near future?*" It's ready to integrate into your risk methodology.

- **Binary Point Vectors**. We measure alignments of opportunity + capability where a hacker's breach is likely. An opportunity only influences risk if there is a capability to exploit it. So unlike other cyber risk scoring methods that can give false indications for every *theoretical*
