

BMIT Work From Anywhere

A Q4-2020 study shows that 100% of business leaders are tired of hearing about the “new normal.” We are too. But there is a silver lining: with the right tools, we can all be surprisingly productive, irrespective of where we are working from. And you need not compromise our business IT security to achieve this.

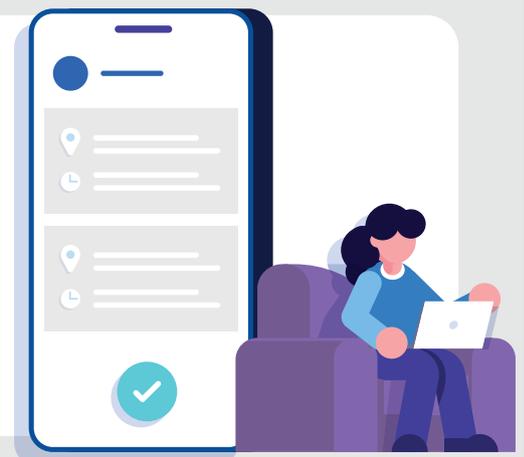

BMIT Work From Anywhere brings together a set of tools, skills and advice that would allow your employees to work from their office, home or wherever they feel like, and at the same time safeguard and secure your business data, systems and resources.

Our Approach

Every business has unique needs, and the initial step is understanding the main pain points, priorities and constraints which your business might be facing. We will handle this stage together and build a practical way-forward in terms of deliverables.

Employee devices (laptops, mobiles, desktops)

As employees use more devices to access your business data and systems, the more challenging it is to keep these devices, the data they access and the whole IT environment secure. For this purpose, we deploy tools which allow us to help you manage what are referred to as endpoint devices. You will be able to analyse and manage all the devices connected to the business from one platform. You can also automate device provisioning, configuration and updates, in a highly secure manner.

Unified communications

We understand that voice calls are still a core component in certain businesses, especially when offering support to external users. But it should not be operated in isolation. We can tap into multiple technologies to integrate your voice telephony service of choice into

a solid unified communications platform, allowing for ease-of-use and substantial savings on your investments.

We will assist in deployment, configuration, integration, updates as well as offer management.

Access to your office tools and software

Every business has a set of systems or tools that are critical to the running of the whole organisation. This could be a CRM, accounting software, stock management system, a business-specific solution, or all these and more. We are increasingly helping businesses move such solutions to the cloud, securely.

But some tools might still need to reside off the cloud. In this case, we can help you deploy an affordable secure virtual desktop set-up. Your employees will be able to access their office computer or servers remotely, view its display, and control its mouse and keyboard as if they are physically at the office.

Productivity & Collaboration tools

With different studies showing that over 75% of employees report higher job satisfaction when being given the option to work remotely, and 59% of businesses noticing improved customer service when offered by remote workers, the work-from-anywhere reality is here to stay. Thankfully gone are the days of piecemeal software to be able to work better and collaborate in an easier fashion.

We have adopted Microsoft 365 as our recommended option since in our opinion it is the best solution out there, with tools that go beyond the obvious. In addition to the popular Word, Excel, PowerPoint and Outlook, employees also have access to Teams, for easy collaboration, massive storage thanks to OneDrive, and a host of other tools. The bonus is security – we can secure data and information in a comprehensive, yet straightforward manner, from access, to forwarding, saving, back-ups and anything in between.

Benefits

- ✓ Access on the go
- ✓ Reduce Costs
- ✓ Faster deployments
- ✓ Remain productive
- ✓ Flexibility
- ✓ Simplify IT device management
- ✓ Scalability
- ✓ Enhance your cloud security

Products

Microsoft Endpoint Management
