# Gomboc

ABOUT US

Gomboc.ai is a NY based security startup, founded by veteran security and cloud practitioners. Our background includes two CISO roles for public companies, and over 10 years of experience at AWS as security and development leaders. We are backed by leading VCs that specialize in cyber security.

We have achieved ISO27001 and SOC 2 Type 2 certifications in 2023 and are obsessed with delivering actionable solutions to our customers as we help them change the way they secure their cloud effectively.

WHAT IS GOMBOC.AI?

Gomboc.ai is a cloud security infrastructure remediation solution (i.e., "self-righting cloud security"). We deliver tailored remediations to your Infrastructure as Code (IaC) in a way that preserves your deployment functionality while fixing any security policy violations.

GOMBOC.AI PROVIDES

Gomboc provide you with a way to define your cloud security policy through a no-code language so that you can have a baseline of how your cloud should look like. We then integrate into your DevOps environment through GitHub to review your IaC (currently Terraform and CloudFormation. Support for Pulumi, Ansible, and more will be available in Q4 2023). We access to your AWS environment through a security auditor role with access to configuration (read-only). Finally - after examining your IaC and actual configuration and aligning it to the policy, we identify any gaps and provide pull-requests that deliver tailored remediations to those gaps. These pull requests contain full documentation on why we are proposing these changes, what those changes are, and links to the corresponding cloud provider services we are proposing to change.

Our scanning is triggered on a configurable action (proposed-pull requests and commits) so that your code and deployment are always reviewed and fixed as your DevOps continuously evolves your application.

Gomboc's AI engine just gets it done for you ▲

- ✅ Eliminates any Security Misconfigurations
- ✅ Eliminates Tickets
- ✅ Tailored Remediation
- ✅ BackLog Zero
- ✅ Better productivity of developers and security creating your optimanl work cadence
- ✅ Existing and Net New changes intact whether coming from company or cloud

WHAT YOU GET?

We address your existing backlog of findings from your CSPMs and other cloud security tools and deliver tailored remediations that work for you and your DevOps seamlessly. We never touch your production environment (all changes need to be approved by DevOps) and can report on your policy posture across your accounts/repositories. We make it easy to define a clear policy and help you make sure that your cloud deployments adhere to it.

We also provide a mechanism to allow for expectations for when specific teams/environments do not need to meet a specific policy statement in a specific environment (such as exclude a policy statement enforcement from dev and test but enforce it in staging and prod).

Reach out to **info@gomboc.ai** and learn how our AI works and how deterministic AI is the better model for creating secure and context-aware IaC.
