

FOOTPRINT DATA MANAGEMENT

We enable companies to deliver on their sustainability promises from vision and goals to strategy, implementation and governance

By use of proven methodologies & best of breed solutions we help companies realizing their sustainability goals

SUSTAINABLE FOOTPRINT

At Nexer, we put our hearts into everything we do and try every day to make a difference for each other, for Nexer as a company and society at large.

We work towards a promising future, which is ready for next generation.

Right now, many companies are transforming to become more data-driven, at the same time as requirements from consumers and regulations are increasing, as to report and share more data on sustainability and the business' environmental impact.

That is why we at Nexer have built a solution, that can house all relevant data subject to sustainability and product environmental footprint requirements.

Working with Nexer, you will meet a partner, who not only offers to implement a flexible and scalable data platform, but who also offers support and guidance in developing processes and strategies that will accelerate the business.

Footprint Data Management

Product Environmental Footprint includes many types and categories of data, usually scattered in different systems, with many attributes, and formats, in need of compilation, centralisation, governance, quality assurance, and syndication.

Footprint Data Management means managing the product's life cycle data and the different Impact Categories included in the EU's PEF methodology such as water, carbon, and/or land use.

Being in control of your footprint means being prepared for any future demands or needs as well as starting to act on lowering your impact.

The market demand for environmentally responsible companies and more sustainable commerce and products is intensifying. That is why you should partner with Nexer, as we offer you the Footprint Data Management solution, which will give you an accelerated 'Starting point' by casting spotlight at your product portfolio, by applying a structured and pragmatic approach to your sustainability journey.
