trustle〉

Your users, managers, and executives don't know they have 24/7 access to your resources
... but attackers sure do.

80% of all identity-based attacks utilize stolen credentials.

33% of them are caused by over-privileged access.

Keep users at zero-standing access with just-in-time access request workflows that provide managers and system owners with visibility and audit trails for all access-related requests, grants, and denials.

"Did you know Kyle still has access? He retired 2 years ago!"

Level up your IAM with Trustle!

Visibility and Control

Identify who has access to what in your environment, with context into access policies, approvals, and unused licenses.

Surface Risks

Detect identity risks - shadow users, overprivileged accounts, unnecessary standing access - and mitigate potential issues.

Streamline Access

Enable seamless risk-based JIT access workflows, with built in expiration and revocation.

A few of Trustle's unique identity management features…

High Risk Account Detection

Eliminate orphaned and unused accounts high-risk accounts – a primary target for attackers.

Privileged Access Analyzer

Determine which of your users are over-privileged, ensuring they have exactly what they need to perform their jobs – and nothing more.

Flexible Workflow Options

Customizable access request workflows let you define rules globally, with the ability to override granularly as needed.

Streamlined Deployment Options
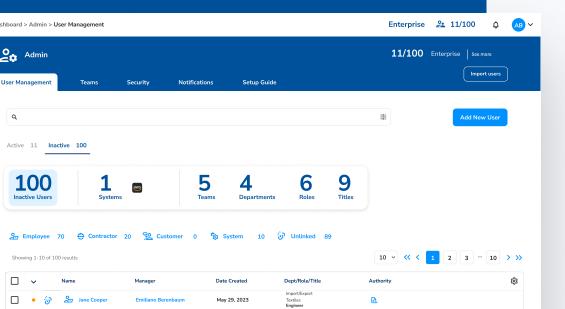

Trustle's frictionless rollout process keep users productive while improving identity security and visibility.

Work where you are

Reduce context switching by requesting and approving access requests from chat, web, or API.

Customize & Integrate

Export and integrate Trustle data with third party systems (SIEM, data warehouses, and more) via the Trustle API.

Right Person, Right Context

Access requests are handled by delegated teams that have context of the requestor's job responsibilities and usage needs.

Full Lifecycle Auditing

Report on ownership and request history of every account and permission in your organization, across all cloud, identity, and service providers.

… plus many more
