How it works

Migration is a process, never a problem.

Transvault Migrator is the secure, compliant and seamless way to migrate email archives. It combines ultra-fast extractions from your archive source with the most efficient ingestion into a huge choice of destinations including Microsoft 365.

Migrator moves journal archives, individual and shared email archives and a wide range of message types with complete fidelity.

It's the only solution that migrates your data in one step, end-to-end, with no interim formats or temporary storage, delivering full and demonstrable chain-of-custody for your data and high confidence that the data has been secure throughout the migration.

Key features

Changing the view on Email Archive migrations

Understand your archives

Prior to migration, Migrator examines your legacy archives, enabling you to understand exactly what data you have and how best to manage its future. You can then move your data selectively, in accordance with a range of criteria such as item size, owner, location, age, flags, etc.

Migration performance and scalability

Available as an on-premises or Cloud-based application (64-bit server technology), Transvault Migrator has a multi-server, multi-location architecture that boosts throughput, reducing wait times and easily delivers scalability.

One step process for compliance

Many businesses have a legislative or information governance requirement to retain data and ensure its integrity and visibility in any relevant eDiscovery scenario, for years, even decades.

With Migrator, businesses can move their records with complete confidence: Banking-style transactional transfer techniques ensure security and prevent data loss or tampering during transmission. Meanwhile a full audit of all activity and detailed reports confirm chain-of-custody for each item moved.

Journal support

Thanks to the universal Transvault Compliance Time Machine, legacy journal archives can be mapped into the Microsoft 365 compliance model from virtually any on-premises or Cloud-based journal solution. This unique service ensures emails belonging to leavers' and all Bcc'd recipients and distribution list members are preserved, manageable and discoverable in a way that is supported by Microsoft 365 going forwards. It also means enterprises don't need to have the extra costs and eDiscovery overheads associated with maintaining a separate journal service, either on-premises or in the Cloud.

Seamless user experience

Advanced shortcut handling and status preservation ensure email archives remain seamlessly accessible to user's post-migration.
