

GP infrastructure migration to Azure - assessment

Transition your GP instance from on-premise infrastructure to Azure

Are you tired of dealing with on-premise infrastructure for your GP 2016 environment? Keeping servers up-to-date, ensuring remote access through Remote Desktop, and making sure your users can always access your system can be a lot to handle for company running Dynamics GP.

Let us help! Dynamic Consulting can help move this application off your existing infrastructure and into the cloud. Microsoft Azure is a best-in-class set of cloud services designed to help your organization scale flexibly.

Specifically, Microsoft's Platform as a Service (PaaS) offerings allow a user to host virtual machines in a secure cloud environment. This structure still provides access to the underlying servers, if needed, but reduces the need to procure and maintain physical infrastructure.

How can we help?

- We'll assess your network environment and determine which machines are needed by the GP environment
- After this assessment, we'll propose an Azure-based offering to replace the on-premise infrastructure
- The offering will include both estimated Azure consumption and our services to perform the migration.
