Appsurify TestBrain

Automation Testing
Reduce automated test completion times by over 95%

Flaky Failures
Automatically quarantine flaky failures so the team can pass the build.

Advanced Reporting
Automatic reporting on why, where, and when tests failed for QA and Developer Teams to help focus their efforts.

Risk Alerts
Pro-active monitoring and alert systems for when a change has been made to important areas of the code.

- Plugs into existing test tools and practices.

- Code Language Agnostic

- Multiple Integrations

- Set-it and Forget-it

Appsurify's TestBrain leverages Machine Learning to determine the areas of an application that have changed after each developer commit, and only runs the subset of tests associated with those changes.

By only running the important tests, teams can drastically cut the amount of time and resources spent testing their software.
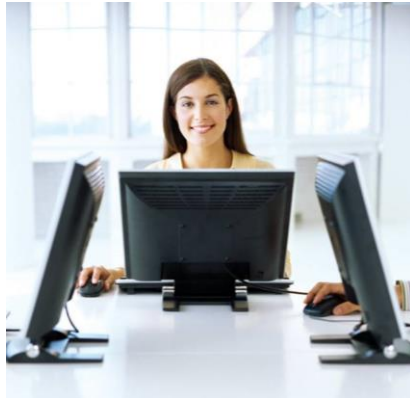

Why test the whole application after any small change, just test the area of the application that has changed with Appsurify TestBrain.

TestBrain was built to help Developer and Quality Assurance teams release higher quality product faster and with fewer defects.

For any type of software testing, such as Functional testing, Unit testing, Integration Testing, System Testing, End-to-End Tests, Smoke Testing, Regression Testing, etc.

TestBrain can help reduce the burden on the Developers trying to ship more confidently, and QA Teams in choosing both speed and quality for application testing.
