Microsoft

Our Unique Technology

Config Data Transfer

As many config entities are hard to transfer (e.g., product catalog, portals, business units, etc.), our approach is to obtain 3-level config process:

- Entity (filter, update or create)
- Attribute (e.g., static, environment specific, hierarchical, hierarchical-multiple-root, AutoResolve etc.)
- Entity Specific Behavior (e.g., DocumentTemplates: Adjust ETC for .docx etc, adx_*, etc.)

Compliance Restriction

Custom scripts are often not ideal for enterprise requirements (e.g., proxies, no plain connection strong/PW, etc.). Our tool fully supports proxy auth., Service Principles, Release Note generation, deep components versioning (JS, C# Assemblies, ..) out-of-the-box.

Data Maintenance

Large datasets are difficult to fix after changing field types (e.g., Timeouts, Trigger or Workflows, etc.). Things like setting global filter for server side-sync or sync of view states can be fully automated with just few clicks.
