**STRENGTHEN
FROM WITHIN!**

**Unlike the source of
a breach, we're quite
easy to find.**

Secure coding habits have assumed prime importance!

With the quantum of attacks and breaches increasing by the month, it is imperative that we realise external tools are not the only viable solution anymore.

The onus also lies on developers to understand the implications of what they're writing and finding vulnerabilities themselves.

Strengthening from within is essential, and we enable that for you!

How we can help

Continuous Learning

We believe that security training should be engaging, tailored to developer skill levels, and framed within a real-world environment.

Our platform is designed to provide targeted challenges for them to recognise and remediate common code defects, improving their fix rate by nearly **20%**.

Our tasks are primarily of three kinds:

- **Defensive:** Users are tasked with fixing a visible vulnerability.
- **Offensive:** Users are tasked with hacking into a vulnerability.
- **Tutorial:** Users are guided through the framework with the help of our bot, Rob.

And there's more...

Workshops

Our browser-based platform can supplement live workshops, allowing developers to discover the newest in software security.

CTFs and Hackathons

Create memorable group experiences with exciting competitions where teams or individuals solve exercises across a variety of security topics.

Onboarding

Integrate and empower new team members, on-site or remotely, by highlighting proper coding practices and setting clear security expectations.
