

ONDATO: BIOMETRIC AUTHENTICATION

It is easy to authenticate returning customers remotely when you are using a resilient solution that automatically determines the validity of their identities. That is why Ondato has developed the Biometric Authentication tool, which helps businesses feel fully confident about their returning clients, keeping their remote processes completely immune to identity fraud.

By combining AI technology, facial recognition, and database checks, Biometric Authentication works in three secure and simple steps:

- The returning client captures a selfie image;
- Ondato creates a biometric 3D face map and automatically compares it to the previously verified one;
- Client's identity is confirmed, granting them access to services.

Our solution is already used by over 210 companies worldwide and it can protect your business from fraudsters, saving money in terms of potential losses and non-compliance fines, just as well.
