Java Application Modernization: 2-Wk Assessment

Estimated period of performance: 2-Weeks

Shadow-Soft understands that many organizations adopt cloud computing to enhance their agility, reduce costs, and drive innovation. To fully realize these benefits organizations must modernize their existing applications using cloud-native principles. These principles include concepts such as loosely coupled service-driven architectures, containerization, elastic infrastructure, and DevOps development. Cloud-native concepts and technologies are still relatively new. Most organizations do not have the required internal skills or experience to implement cloud-native computing effectively.

What's Included:

- Comprehensive assessment process uses a combination of automated application discovery and traditional requirements gathering to understand actual resource consumption, business, cultural and regulatory requirements
- Provides a migration plan based on a proven methodology that includes best-practices for creation of landing zone, use of IAM, etc
- Identify opportunities for application decoupling to provide immediate agility and ROI for cloud adoption
- Develop architectural recommendation based on five pillars of the cloud framework - operational excellence, security, reliability, performance efficiency, and cost optimization
- Identity and apply available Proof of Concept (POC) funding from public cloud providers to offset initial migration costs
- Customized migration path based on your organization's cloud maturity
- Ongoing cost and expense management service once a workload is implemented

Key Benefits:

- Decrease time with cloud-native architecture to enable increased agility and extensibility
- Shorten application release cycles by using cloud-native design patterns alongside agile and DevOps techniques
- Enhance agility and speed of your IT systems to support a digital transformation initiative
