# Live debugging. Anywhere

Reproducing issues locally is time consuming and expensive. And it is not always possible.
Some issues can only be handled by fetching log lines from a live application.
But what does that entail?

Your engineers spend a significant amount of time waiting for log lines and metrics that are crucial for troubleshooting.

Rookout empowers software engineers and allows live debugging of remote and distributed applications. With a developer friendly user experience, Rookout adds log lines and fetches data with a click of a button.

Without changing code and without restarting the application, Rookout provides the quickest and safest live debugging experience available today.
