AI for Scalable Intelligent Automation

Effectively implementing intelligent automation at scale is crucial for success in the enterprise, however, this remains a challenge with large organizations because of a lack of resources to streamline business process discovery, gather accurate data, and then easily kick off automated workflows.

Combining the strength of FortressIQ and Microsoft Power Automate, organizations can quickly obtain details on their current state operations, easily pinpoint the most optimal areas for automation, and execute RPA and automation initiatives on the fly – with no coding required.

Fortress IQ

Digital Process Discovery and Documentation

FortressIQ delivers the first cognitive process intelligence solution to combine computer vision, natural language processing, and artificial intelligence to automatically discover, map, model, and document all the digital processes and sub-tasks executed across all solutions and apps by an organization's workforce.

Using AI-driven technology, the discovery method generates process documentation automatically, allowing customers to map processes in record time, transparently providing the most holistic view of their current state digital operations.

Automation for All

Power Automate democratizes intelligent automation by empowering everyone—from business users on the frontline to experts at the forefront of technology—to seamlessly build secure, automated solutions that brings together robotic process automation **(RPA)** and digital process automation **(DPA)** into a single cloud-based solution.

As a true cloud-based SaaS offering, Power Automate empowers everyone to automate processes with the efficiency of a low-code solution. Organizations can now automate highly repetitive, manual tasks and reduce the risk of error while allowing the workforce to focus on what matters most.

Digital Transformation at Scale

For automation projects to succeed, companies need a complete and accurate understanding of the processes they want to automate before implementing RPA software. Typically, one-third of the time allocated for automation is spent on documenting processes and reviewing them for automation potential, creating an upfront bottleneck in the timeline. The sooner enterprises can get bots up and running, the sooner they can start realizing ROI from their automation initiatives.

Together, FortressIQ and Power Automate provide customers the following benefits:

- Accelerated productivity – discover processes without business interruption to the workforce, allowing workers to focus on more strategic work
- Automation at scale – efficiently scale RPA bots and automation workflows across the organization
- Accuracy and security – easily implement intelligent workflows across apps without worry
- Efficient, intelligent automation – automated business process discovery, documentation and workflows with the power of AI

Companies using FortressIQ and Power Automate can save significant time and money across the lifespan of their automation projects, and can start surfacing insights in weeks.
