

MIMIRAS

Secure your business and have more time for innovation and development with Cloud Cop

Mimiras develops the product Cloud Cop, which simplifies and automates the administration of Azure Governance, so you can free up time for innovation and development.

Cloud Cop helps move tasks related to Azure Governance closer to the business and to roles other than the cloud specialists. This allows specialists to spend their time on more value-creating work.

Through user-friendly interfaces, even non-technical roles can define and implement rules to ensure that the business complies with regulatory requirements

and guidelines, because everyone who works on the company's Azure solution is forced to follow the framework and rules you have implemented.

Get started quickly, ensure compliance, achieve simple management, and facilitate better value creation in the company.

Why you should choose Cloud Cop

Prepare for the future.

Most businesses that use Azure do so gradually. It's therefore easy to forget the consequences of future scaling when the complexity gradually builds up, which can be difficult to deal with. Think right from the start and get started with some rules to be prepared to face the complexity you get over time in your platform. Even if you have come a long way, it is never too late to establish new cultures, structures and conditions. Cloud Cop will help you with.

Set your own terms.

All businesses are subject to certain requirements, rules and guidelines, both external and internal that must be complied with. This is the business itself that is responsible for. To avoid consequences of not complying with rules, we recommend that the business itself has control over the fact that rules are implemented and updated.

Use of best practices.

In Azure, there are countless templates and great recommendations. We want you to be able to take advantage of this without having to use expertise on Azure. The goal of Cloud Cop is to be able to give you recommendations in accordance with best practice so that you can more easily and efficiently establish the right rules for your business.

You facilitate increased value creation.

Despite the fact that Azure has good reporting tools and valuable information about your environment, you still need to ensure good and relevant input. You do this by establishing rules in the platform that ensure that this information is actually entered. In this way, the company gets a much better reporting basis for cost control, security, development and operation.
