Case Study: National Behavioral Healthcare Provider

Client Requirements

Client is a national leader in behavior healthcare services. Client desired to move its core application suite to Azure which required replatforming and the deployment of Azure, private cloud, and colocation environments.

Atmosera Solution

Design:
A National Healthcare Provider (NHP) used on-prem and externally hosted systems for their mission critical core application and several supporting applications. Systems availability and uptime was paramount and PHI data required a compliant solution.

Atmosera assessed, architected, and deployed an Azure HITRUST environment for the replatforming of new core application. Atmosera assessed, architected, and migrated the existing core application into a HIPAA private cloud while assessing and migrating supporting legacy applications into a compliant colocation environment. All three environments were brought under singular management control for 24x7x365 management.

Value Delivered:
- Improved reliability, performance, and data resiliency
- New application leveraged Azure PaaS for improved economics
- Hybrid deployment for best fit of applications
- Utility consumption model vastly improved economics
