

Integrated and simplified compliance strategy workshop that reduces risk

A multi-national manufacturing company needed a compliance strategy as its growth resulted in an increasing amount of data ranging from documents and emails to videos, images, and more. The company realized this explosion of data dramatically increased their risk exposure.

To further complicate matters, there was little collaboration between all involved teams; Legal, Compliance, Security, IT, and HR. The company struggled with understanding and responding to data inquiries.

The decades-old manufacturer looked to Lighthouse, a long-time Microsoft partner, to create a go-forward strategy and a simplified and unified approach. Lighthouse's team of experts was brought in to hold an intensive workshop and a compliance check overview.

The goal was to provide insights to their all involved teams on risks related to over retention of data and the need for a governance structure for Microsoft 365.

Gain insight in the organizations data across the Microsoft Cloud.

Discuss and understand the hidden compliance risks of dark data.

Enable, track and review suspicious user activity using Microsoft 365 tools.

At-a-glance

Lighthouse Customer

Customer Size: Large global company with over 45,000 employees

Country: Global

Industry: Manufacturing

Products and Services: Lighthouse Discover Sensitive Data Workshop

Global manufacturing company effectively manages security and protects data

Customer Challenges

A large multi-national manufacturing company's growth resulted in an increasing concern over data security and privacy.

The company was struggling to respond to data inquiries and frequently had to consult with costly outsourced advisors.

All involved teams needed assistance in developing a cohesive plan to adopt a strategy that would work for both teams.

Partner Solution

Microsoft Field Sales team, along with Lighthouse, conducted a workshop to illuminate sensitive data and educate the client's teams on information governance and insider risk.

An in-depth analysis using Microsoft 365 tools showed all data sources and uncovered unused, stale data, and unusual data activity. A framework was developed to discover, protect, and govern the customer's data.

The Results

This workshop created a long-term strategy that minimized risk and helped bring the Legal, Compliance, Security, IT, and HR teams together towards the common goal of information governance. Lighthouse brought all the constituents together and educated the teams involved. Leveraging Microsoft 365 tools, Lighthouse was able to help the customer tailor an information governance policy. Information Governance roles were clearly defined; a proactive incident response plan was developed. The company now has an end-to-end data lifecycle that provides for ongoing assessments and reviews to manage risk. They now have clear information definition to drive value from their data assets as well as a plan to eliminate unused or stale data.
